There is no other unsignalized study area intersections anticipated to meet peak hour volume-based traffic signal warrants under Horizon Year (2040) Without and With Project traffic conditions in addition to the location previously warranted under Existing traffic conditions (see Appendix 6.3 and Appendix 6.4).

6.6 QUEUING ANALYSIS

A queuing analysis was performed for the signalized study area intersections to assess vehicle queues for the turn pockets that may potentially "spill back" into the adjacent through lanes. Queuing analysis findings are presented in Table 6-2 for Horizon Year (2040) Without and With Project traffic conditions. As shown in Table 6-2, the following turning movements are anticipated to experience queuing issues for Horizon Year (2040) Without Project traffic conditions (see Appendix 6.5):

- Doolittle Dr. & Davis St. (#5) – Southbound left PM peak hour only
- Doolittle Dr. & Davis St. (#5) – Westbound right turn lane AM and PM peak hours
- Doolittle Dr. & Williams St. (#6) – Southbound left PM peak hour only
- Doolittle Dr. & Marina Bl. (#7) – Southbound left AM and PM peak hours
- Doolittle Dr. & Marina Bl. (#7) – Westbound left AM and PM peak hours
- Warden Av. & Davis St. (#8) – Southbound left AM peak hour only

TABLE 6-2: PEAK HOUR TURN LANE QUEUING SUMMARY FOR HORIZON YEAR (2040) CONDITIONS

BOLD = 95th percentile queue exceeds the available storage.

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet (1 car length) of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] Although 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-880 Freeway mainline.

- Airport Access Rd. & 98th Av. (#11) – Southbound left PM peak hour only
- Airport Access Rd. & 98th Av. (#11) – Westbound left PM peak hour only
- Merced St. & Marina Bl. (#14) – Westbound left AM peak hour only

The addition of Project traffic to these pre-project deficiencies is anticipated to result in nominal changes (see Appendix 6.6). There are no new queuing deficiencies anticipated as a result of Project traffic.

6.7 RAILROAD QUEUING ANALYSIS

The queuing analysis results for the at-grade railroad crossings have also been summarized on Table 6-3 for Horizon Year (2040) With Project traffic conditions only. As shown in Table 6-3, only the westbound through movement at Doolittle Drive and Marina Boulevard may potentially extend back to the at-grade railroad crossing. It should be noted that while the 95th percentile queue indicates a queuing issue in the PM peak hour only, the average (50th percentile) peak hour queue does not. The 95th percentile queue, while typically used for design purposes, in reality occurs approximately 5 percent of the time. The existing railroad crossing has striping and signing for advance notification of the crossing in both directions of travel on Marina Boulevard. In addition, the crossing itself is equipped with mast arms and warning lights. A potential recommendation for the City to improve peak hour queues in the westbound approach would be to modify the signal timing at Doolittle Drive and Marina Boulevard to clear any queues in advance of approaching trains. Worksheets for Horizon Year (2040) traffic conditions queuing analysis worksheets are provided in Appendix 6.7.

TABLE 6-3: AT-GRADE RAILROAD CROSSING PEAK HOUR QUEUING SUMMARY

#	Intersection	Movement	Available Stacking Distance (Feet)	2040 With Project			
				95th % Queue (ft)		Acceptable?[1]	
				AM	PM	AM	PM
4	Doolittle Dr. & Project Driveway	WBL/R	265	150	86	Yes	Yes
5	Doolittle Dr. & Davis St. (SR-112)	NBT	380	265	103	Yes	Yes
6	Doolittle Dr. & Williams St.	WBT	840	222	346	Yes	Yes
7	Doolittle Dr. & Marina Bl.	WBT	840	419	**932**	Yes	**No**

BOLD = 95th percentile queue exceeds the available storage.

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet (1 car length) of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

6.8 RECOMMENDED IMPROVEMENTS

Improvement strategies have been recommended at intersections that have been identified as deficient under Horizon Year (2040) Without and With Project traffic conditions and where the addition of Project traffic would have a significant effect. Improvements have been identified in an effort to achieve an acceptable LOS (i.e., LOS D or better).

6.8.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

The effectiveness of the recommended improvement strategies to address Horizon Year (2040) With Project traffic deficiencies are presented in Table 6-4. As noted previously, the addition of Project traffic is anticipated to have a significant effect on the intersection of Doolittle Drive and the Project Driveway only. The addition of Project traffic at the other four deficient locations is anticipated to result in a change to the v/c ratio of less than 0.05. As such, no improvements have been recommended at those locations for Horizon Year (2040) With Project traffic conditions. It is recommended that the Project contribute fair share payment towards the recommended improvement (signalization). Worksheets for Horizon Year (2040) With Project conditions, with improvements, HCM calculation worksheets are provided in Appendix 6.8.

TABLE 6-4: INTERSECTION ANALYSIS FOR HORIZON YEAR (2040) CONDITIONS WITH IMPROVEMENTS

			Intersection Approach Lanes[1]												Delay[2] (secs.)		Level of Service	
		Traffic	Northbound			Southbound			Eastbound			Westbound						
#	Intersection	Control[3]	L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM
4	Doolittle Dr. & Project Dwy.																	
	Without Improvements	CSS	0	2	0	1	2	0	0	0	0	0	1	0	**38.5**	25.6	**E**	D
	With Improvements	**TS**	0	2	0	1	2	0	0	0	0	0	1	0	9.4	7.4	A	A

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right

[2] Per the Highway Capacity Manual (HCM 2000), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] CSS = Cross-Street Stop; TS = Traffic Signal; **TS** = Improvement

Table 6-5 provides the fair share calculation for the intersection of Doolittle Drive and Project Driveway. As stated above, the Project should contribute fair share payment towards the identified improvement at this location.

TABLE 6-5: PROJECT FAIR SHARE CALCULATIONS

#	Intersection		Existing	Project	Horizon Year (2040) With Project	Total New Traffic	Project % of New Traffic
4	Doolittle Dr. & Project Dwy.						
		AM:	1,963	39	2,140	177	**22.0%**
		PM:	1,958	-16	2,294	336	0.0%

BOLD = Denotes highest fair share percentage.

6.8.2 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON QUEUES

As shown previously in Table 6-2, there are movements anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows under Horizon Year (2040) traffic conditions. However, these are pre-project queuing issues, and the addition of Project traffic is anticipated to have a nominal effect on the peak hour queues. The peak hour intersection operations analysis for these study area intersections show that the addition of Project traffic is not anticipated to have a significant effect (v/c increase of less than 0.05). Similarly, the addition of Project traffic is also not anticipated to have a significant effect to the PM peak hour queue identified at the intersection of Doolittle Drive and Marina Boulevard on Table 6-3. As such, consistent with the peak hour intersection operations analyses, no improvements have been recommended to address the peak hour queuing deficiencies.

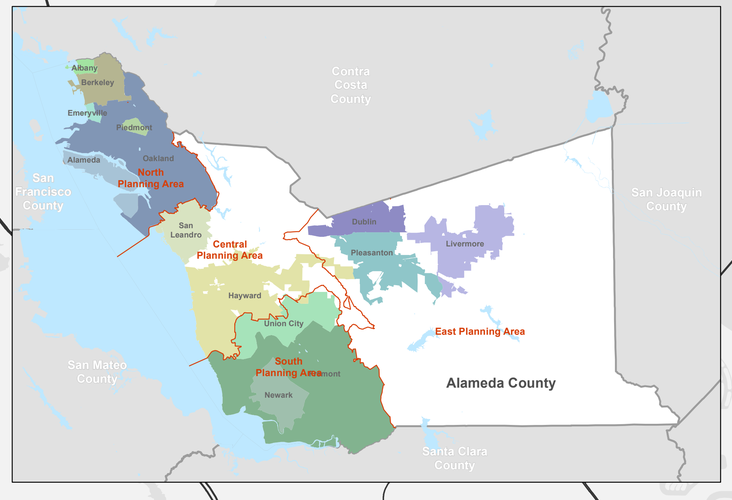
Data Source: Alameda Countywide Travel Model, Plan Bay Area 2040 version, May 2019



Vehicle miles traveled (VMT) = home-based trips (home-based work, school, shopping/errands, social/recreation) at transportation analysis zone (TAZ) containing residence site

VMT also includes estimates of non-home trips generated by residents at the non-residential end of the home-based trip (e.g. lunch trips from workplace)

VMT per capita = home-based VMT at residence TAZ divided by total population in TAZ

VMT includes all travel within 9-county Bay Area plus San Joaquin County plus estimates of travel distances beyond the 10-county model area

TAZs with zero values (white) did not have population in the 2020 model

Intersection Summary	
HCM 6th Ctrl Delay	110.7
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary	
HCM 6th Ctrl Delay	62.7
HCM 6th LOS	E

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

HCM 6th Ctrl Delay	89.7
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary	
HCM 6th Ctrl Delay	127.4
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

HCM 6th Ctrl Delay	67.4
HCM 6th LOS	E

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary	
HCM 6th Ctrl Delay	156.8
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary	
HCM 6th Ctrl Delay	177.8
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary	
HCM 6th Ctrl Delay	129.6
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary	
HCM 6th Ctrl Delay	173.2
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

1.0 INTRODUCTION

On behalf of Leandro Brookshire LLC, (Leandro Brookshire; Property Owner), RMD Environmental Solutions, Inc. (RMD; Environmental Consultant) has prepared this *Soil and Groundwater Management Plan* (SGMP) for the former Kaiser Aerotech facilities located at 880 Doolittle Drive and 498 Hester Street in San Leandro, California (the Site; Figure 1). This SGMP has been revised to incorporate responses to May 7, 2021 California Department of Toxic Substances Control (DTSC) comments.

Environmental response activities are conducted pursuant to an *Imminent and Substantial Endangerment Determination and Order and Remedial Action Order* (Order), which was issued by the DTSC in June 2004. Environmental response activities, including remedial actions, have been implemented to address chlorinated volatile organic compounds (CVOCs) observed in the Site subsurface. DTSC certified the Site in a January 23, 2013 correspondence and indicated that all response actions, except for long-term operation and maintenance (O&M) activities, have been completed. In conjunction with environmental response activities, a *Land Use Covenant* (LUC) was filed with Alameda County in 2012 to ensure that the Site is not used for sensitive land uses (Appendix A). O&M activities and annual LUC inspections are routinely conducted to evaluate groundwater conditions and remedial progress at the Site.

1.1 Anticipated Redevelopment Project Description

The Site is planned for commercial redevelopment, which is expected to include demolition of the existing buildings and construction of a new approximately 97,240 square-foot commercial building in the north-central portion of the property with associated on-grade parking, loading, and staging areas, and an above-grade parking area on a canopy structure (Figure 2). This SGMP is intended to address potential subsurface issues that may be encountered during redevelopment of the Site. The redevelopment activities may include, but are not limited, to the following:

- Demolishing existing buildings, foundations, and pavement;
- Constructing new buildings for commercial/industrial use, including Site grading and installing foundations and pavement;
- Repairing, replacing, removing, and/or installing underground utilities; and
- Excavating and backfilling small areas or potholes for installation of signs, traffic bollards, or similar.

1.2 Purpose and Objectives

The purpose of this SGMP is to provide guidance for proper handling, management, and disposal of impacted soil and groundwater that may be encountered during the activities described above. The objectives of the SGMP include:

- Communicating information to onsite workers about environmental conditions at the Site;
- Presenting protocols for management of known impacted soil or groundwater encountered during redevelopment activities; and
- Presenting measures to evaluate and mitigate potential risks to the environment, onsite workers, and other nearby offsite receptors from potential exposure to hazardous substances that may be associated with unknown conditions or unexpected underground structures (as defined in Section 5.0).

1.3 SGMP Organization

The remainder of this SGMP is organized into the following sections:

- **Section 2.0 - Background and Physical Setting:** Provides a description of the Site, hydrogeologic conditions, constituents of potential concern (COPCs), remediation activities, and current Site conditions;
- **Section 3.0 – Project Contacts, Responsibilities, and Notifications:** Provides a list of construction team contacts and their responsibilities, agency notifications, and a summary of notification procedures related to regulatory oversight agency, underground utility clearance, permitting, health and safety, and existing groundwater well network;
- **Section 4.0 – Soil Management:** Provides procedures for field screening and assessment of potentially impacted soil, soil stockpile handling, decontamination, and soil importation;
- **Section 5.0 – Contingency Measures for Discovery of Unexpected Underground Structures:** Provides procedures to respond to the discovery of previously unidentified or unknown underground structures;
- **Section 6.0 – Erosion, Dust, and Odor Management:** Provides procedures to control erosion, dust, and fugitive emissions, which may produce odor and vapor emissions;
- **Section 7.0 – Groundwater Management:** Provides procedures to manage any accumulated groundwater encountered during redevelopment activities;
- **Section 8.0 – Waste Management:** Provides procedures for proper storage, handling, reuse, and disposal of contaminated soil, wastewater, and groundwater;

- **Section 9.0 – Stormwater Management:** Provides procedures to manage stormwater runoff;
- **Section 10.0 – Written Records and Reporting:** Provides a list of field documentation and reporting requirements;
- **Section 11.0 – References:** Provides list of references cited in this SGMP; and
- **Section 12.0 – Limitations:** Provides limitations associated with data, conclusions, and recommendations presented in this SGMP.

1.4 Agreement and Acknowledgement Statement

Prior to commencement of redevelopment activities that disturb the ground surface, the General Contractor and subcontractors of the Property Owner will be required to read this plan and sign the Agreement and Acknowledgement Statement (Appendix B) to certify that they have read, understood, and agree to abide by its provisions.

2.0 BACKGROUND AND PHYSICAL SETTING

This section summarizes the Site background and physical setting.

2.1 General Site Information

Site name: Former Kaiser Aerotech Facilities (Kaiser Aerotech)

Site address: 880 Doolittle Drive and 498 Hester Street, San Leandro, California (Figures 1 and 3)

Current property owner: Leandro Brookshire LLC

Current phase of project: Operation and Maintenance and Monitoring

Number of wells: 55 (52 onsite, 3 offsite; Figure 3 and Table 1)

2.2 Site Location and Description

The Site is located east of Doolittle Drive between 98th Avenue and Davis Street in a commercial/industrial area of San Leandro, California (Figure 1).

The Site consists of two parcels:

- The 880 Doolittle Drive parcel, Alameda County Assessor's Parcel Number (APN) 77A-741-4-2, is approximately 10-acres in size and consists of several buildings including a 5,000 square-foot administration building, a 175,000 square-foot northern building and an 87,500 square-foot southern building, which are connected by a breezeway (Figure 3). The remainder of this parcel is asphalt-paved with limited landscaped areas. Kaiser Aerotech manufactured aerospace and/or aircraft equipment at the 880 Doolittle parcel from approximately 1955 to 1996, when these operations ceased and the manufacturing equipment was dismantled.
- The 498 Hester Street parcel, APN 77A-741-5, is approximately 4-acres in size and is asphalt-paved (Figure 3). Kaiser Aerotech used the 498 Hester Street parcel for employee parking, light manufacturing, and storage between 1963 and 1976. Between 1976 and 2002, most of the 498 Hester Street parcel was leased to other businesses including a cargo container repair and storage company and a light manufacturing company. The area was paved in December 2003.

From the early 2000s to May 2020, Expresso Airport Parking operated at the Site to provide off-airport parking and the former manufacturing buildings were repurposed as indoor parking. Currently, the Site is leased for outdoor parking.

2.3 Hydrogeologic Setting

The Site subsurface consists of the following hydrogeologic zones:

- **Vadose zone:** Ground surface to the top of the water table at approximately 5 feet below ground surface (bgs);
- **A-zone:** Approximately 5-15 feet bgs; thin, discontinuous sand lenses;
- **B-zone:** Approximately 15-35 feet bgs; thicker sand channels enveloped by fine-grained soil;
- **Fine-grained soil:** Approximately 35-45 feet bgs; interpreted aquitard; and
- **C-zone:** Below approximately 45 feet bgs; thicker, more laterally continuous sand intervals.

In general, horizontal hydraulic gradients are toward the west in each of the three water-bearing zones. Groundwater is typically observed at approximately 5 to 7 feet bgs in the A-zone. Groundwater elevations in A-zone wells are typically similar to those in adjacent B-zone wells and are below those in adjacent C-zone wells. Groundwater well locations are shown on Figure 3 and well construction details are summarized in Table 1.

2.4 Constituents of Potential Concern

The primary COPCs at the Site are trichloroethene (TCE) and its associated degradation products, cis-1,2-dichloroethene (DCE), trans-1,2-DCE, and vinyl chloride (VC). TCE is considered the primary indicator COPC based on historical Site operations (ETIC Engineering, Inc. [ETIC], 2002). TCE and its degradation products were distributed throughout the A-zone and B-zone, but were not widely reported in C-zone samples. Tetrachloroethene (PCE) is largely limited to the A-zone and upper portion of the B-zone near the railroad/western boundary and is considered to be the result of an offsite source.

2.4.1 Pre-Remediation Distribution of TCE

In general, the maximum pre-remediation TCE concentrations were:

- Less than 5,000 micrograms per liter (µg/L) in a limited portion of the A-zone;
- More than 100,000 µg/L in the B-zone immediately beneath and adjacent to suspected former release areas (see below); and
- Less than maximum contaminant levels (MCLs) in the C-zone.

Based on the site conceptual hydrogeologic model (ETIC, 2002), the isolated, discontinuous, and thin sands of the A-zone limit the migration of COPCs, while the relatively thick, east-west running B-zone sand channels may act as preferential pathways for COPC migration. The pre-remediation distribution of TCE in soil and groundwater is illustrated in figures included in Appendix C1.

2.4.2 Source Evaluation

During Kaiser Aerotech operations in 1991, a 1,000-gallon gasoline underground storage tank (UST) was removed from near well MW-6 on the 880 Doolittle Drive parcel. When Kaiser Aerotech ceased its operations in 1996, other storage tanks were decommissioned and residual solvents were removed from the Site. Possible additional sources were removed when a container repair tenant relocated from the 498 Hester Street parcel in 2002. Correspondingly, no primary sources (e.g., storage or former degreasing tanks) of COPCs are known to remain at the Site.

Although there are no known primary sources, secondary sources, indicated by TCE concentrations exceeding 100,000 µg/L, were identified in the B-zone. Based on this information and the observed distribution of COPCs in the subsurface, secondary source areas that were associated with suspected former release areas included:

- Former degreasing tank no. 1, which was located east of the northern building;
- Former degreasing tank no. 4, which was located inside the northern building;
- Former breezeway sump, which was located at the western end of the breezeway between the northern and southern buildings;
- Former oil/solvent storage area, which was located northeast of the northern building; and
- Former receiving dock for a railroad spur, which was located at the property boundary east of the breezeway (Figure 3).

Other source areas that were identified based on COPC distribution, but not associated with known manufacturing Site activities (e.g., tanks, sumps) include:

- Isolated A-zone TCE hotspots; and
- The parking lot near the railroad/western boundary. This area is believed to result from an offsite source as PCE is reported at elevated concentrations in this area, but not the former release areas at the Site.

2.5 Remediation Activities

As described in the *Final Remedial Action Plan* (RAP; The Source Group, Inc. [SGI], 2008a) and *Remedial Design and Implementation Plan* (RDIP; SGI, 2008b), the remediation scope of work included enhanced reductive dechlorination (ERD) of onsite areas with TCE concentrations of more than 1,000 µg/L through the injection of electron-donor substrate, and monitored natural attenuation (MNA) in lower concentration areas (see below). Since June 2008, injections were completed through 41 existing wells in higher concentration areas where more substrate and potentially recurring injections were anticipated, with supplemental injections using 183 direct-push borings to further distribute substrate in the subsurface. Routine groundwater monitoring results are used to evaluate Site conditions and remedial progress. Tables summarizing ERD injection activities and a figure illustrating injection locations are included in Appendix C2.

2.6 Land Use Covenant

In 2012, a *Land Use Covenant* (LUC; Appendix A) was filed with Alameda County to ensure that the Site is not used for the following: residences, hospitals for humans, public or private school for persons under 21 years of age, and day care center for children. The LUC requires DTSC approval of any planned future use of groundwater at the Site and a *Soil Management Plan* prior to any planned disturbance of subsurface soil in two limited areas of the Site. These soil management areas are near well MW-3 and boring CB-28 (Figure 3).

2.7 Overview of Current Site Conditions

The following summarizes the general findings of the groundwater monitoring event conducted in March 2020 (RMD, 2020a) and subslab vapor and indoor air monitoring events conducted in April 2020 (RMD, 2020b) and the soil vapor sampling events conducted in October 2020 (RMD, 2020d) and January 2021 (RMD, 2021a). Due to the generally low concentration and limited extent of COPCs in vadose zone soil prior to remediation (e.g., only two areas warranted consideration in the LUC), shallow depth to water, and use of groundwater monitoring results as the primary

indicator of remedial progress, soil samples have not been recently collected. The historical soil, groundwater, and subslab vapor, indoor air, and soil vapor data are summarized in Appendices C3, C4, and C5, respectively.

2.7.1 Groundwater

Based on the site conceptual hydrogeologic model, groundwater elevation contours in the A-zone indicate an aggregate westward horizontal hydraulic gradient with water levels largely controlled by the variable saturation of isolated, discontinuous, and thin sand lenses (Figure 4). Westward horizontal hydraulic gradients are also indicated by groundwater elevations for B-zone wells (Figure 5). Note that an eastward hydraulic gradient is locally present in the railroad/western boundary area, perhaps due to seasonal recharge/discharge associated with storm drain trench fill material located east of the fence line (Figure 4).

Groundwater levels fluctuate seasonally, with similar elevations in the A-zone and B-zone, and higher elevations in the C-zone. These data indicate a consistently upward vertical hydraulic gradient between the C-zone and B-zone, and a muted vertical hydraulic gradient between the B-zone and A-zone. Groundwater level measurements collected during the March 2020 event are generally consistent with historical data and patterns presented in previous monitoring reports.

General findings for Site COPCs in groundwater are briefly described below.

- TCE concentrations between 10-100 µg/L were reported in A-zone wells MW-3, MW-5, MW-11, MW-17 and MW-26 and B-zone wells LB-3, LB-5, LMW-3, LMW-5, and PZ-1. The distribution of TCE in the A-zone and B-zone are presented in Appendix C4;
- cis-1,2-DCE concentrations of 10,000 µg/L or more were reported in B-zone wells LB-5 and PZ-1. Concentrations between 1,000-10,000 µg/L were reported in A-zone well MW-21 and B-zone wells LB-3, LB-4, and LPZ-5. Supplemental electron-donor substrate injections were conducted near these wells in July 2020;
- trans-1,2-DCE concentrations of 100 µg/L or more were reported in A-zone well MW-21 and B-zone wells LMW-3 and LMW-7;
- Vinyl chloride concentrations of more than 10,000 µg/L were reported in B-zone wells LB-5, LPZ-5, and PZ-1. Concentrations between 1,000–10,000 µg/L were reported in B-zone wells LB-3, LB-4, and LPZ-3; and
- PCE was not detected in the onsite well samples at concentrations above laboratory reporting limits.

Elevated concentrations of PCE and TCE were reported in offsite A-zone well FA-1 and B-zone well FUB-1.

In summary, the groundwater monitoring data indicate that ERD has successfully reduced TCE concentrations in the onsite wells to near or below its MCL (5.0 µg/L) in most of the treatment areas. In several areas, the return toward ambient conditions and more limited ERD have not resulted in TCE concentration rebound above 100 µg/L. In the A-zone and B-zone MNA wells, the generally stable-to-decreasing concentrations of TCE and its degradation products (e.g., cis-1,2-DCE, vinyl chloride) observed during routine groundwater monitoring are consistent with ongoing natural attenuation in lower concentration areas. The need for further electron-donor substrate injections and continued natural attenuation will be evaluated through routine groundwater monitoring.

2.7.2 Subslab Vapor, Indoor Air, and Soil Vapor

In anticipation of potential redevelopment activities at the Site, subslab vapor, indoor air, and soil vapor sampling events were conducted. In April 2020, 12 subslab vapor points were installed and sampled and three ambient air samples, 13 indoor air samples, and one duplicate indoor air sample were collected at the Site. In October 2020, eight soil vapor probes were installed and sampled at approximate depths of 4.75-5 feet bgs. In January 2021, three soil vapor probes were installed and sampled at approximate depth of 4.25 feet bgs. During these investigations, for the purpose of evaluating potential vapor intrusion impacts to future commercial worker receptors, three subslab vapor sample locations (VP-2, VP-4, and VP-6) and 11 soil vapor sample locations (SVP-1 through SVP-11) were located immediately adjacent to or within the proposed building footprint (Appendix C5).

In the 2020 and 2021 vapor samples, TCE, PCE, cis-1,2-DCE, vinyl chloride, benzene, and ethylbenzene were detected at concentrations exceeding the commercial/industrial screening levels (SLs) in subslab vapor and soil vapor sample samples (using a conservative USEPA [2015] soil vapor to indoor air attenuation factor [AF] of 0.03). PCE, cis-1,2-DCE, and ethylbenzene concentrations above the commercial/industrial SLs were only observed in one or two vapor samples. TCE, vinyl chloride, and benzene concentrations above the commercial/industrial SLs were more widely observed and are discussed as follows:

- TCE was detected above the commercial/industrial SL of 100 micrograms per cubic meter (µg/m^3) in 10 subslab vapor samples and a duplicate sample and two soil vapor samples and a duplicate sample at concentrations ranging from 196 µg/m^3 in subslab vapor point VP-11 to 17,500 µg/m^3 in subslab vapor point VP-7.

- Vinyl chloride was detected above the commercial/industrial SL of 5.3 µg/m^3 in eight soil vapor samples and one duplicate sample at concentrations ranging from 13.6 µg/m^3 in soil vapor probe SVP-8 Dup to 1,300 µg/m^3 in soil vapor probe SVP-9. Vinyl chloride was not detected above laboratory RLs in the subslab vapor samples.
- Benzene was detected above the commercial/industrial SL of 14 µg/m^3 in nine soil vapor samples and one duplicate sample at concentrations ranging from 24.9 µg/m^3 in soil vapor probe SVP-7 to 217 µg/m^3 in soil vapor probe SVP-3. Benzene was not detected above the commercial/industrial SL in the subslab vapor samples.

In general, indoor air concentrations were consistent with background, ambient concentrations and benzene was the only volatile organic compound (VOC) detected at concentrations exceeding the commercial/industrial SLs, as follows:

- Benzene was detected above the commercial/industrial SL of 0.42 µg/m^3 in the 13 indoor air samples and one duplicate sample at concentrations ranging from 0.498 µg/m^3 to 0.971 µg/m^3 (Appendix C5). Similarly, benzene was detected in the three ambient air samples at concentrations ranging from 0.396 µg/m^3 to 0.668 µg/m^3. At the time of sampling, the buildings were used for off-airport parking. As such, vehicles were operating within and outside the building. Vehicular exhaust likely contributed to the benzene concentrations detected in both indoor and ambient air samples.

No other VOCs were detected in the ambient or indoor air samples at concentrations above commercial/industrial SLs. In addition, the TCE concentrations in the ambient or indoor air samples were well below the DTSC indoor air accelerated response action level (ARAL) of 8.0 µg/m^3 and urgent response action level (URAL) of 24 µg/m^3 for commercial/industrial exposures for an 8-hour workday (DTSC, 2014).

2.7.3 Vapor Intrusion Human Health Risk Assessment

Three subslab vapor sample locations (VP-2, VP-4, and VP-6) and 11 soil vapor sample locations (SVP-1 through SVP-11) were located immediately adjacent to or within the proposed building footprint. The soil vapor sample results from these probes were used to evaluate potential vapor mitigation measures for the proposed commercial building in the *Vapor Intrusion Human Health Risk Assessment for Future Commercial Worker Receptors* (HHRA; RMD, 2021b). In the HHRA for exposure to soil vapor volatilizing into indoor air in an onsite commercial exposure scenario, using an AF of 0.03, the resulting hazard index (HI) of 3 is above the acceptable target level of 1 and the cumulative excess cancer risk estimate of 1 x 10^{-4} is at the upper end of the California Environmental

Protection Agency's (CalEPA's) risk management range. Using an AF of 0.0005 for a future commercial building (DTSC, 2011), the resulting HI of 0.05 is below the acceptable target level and the cumulative excess cancer risk estimate of 2×10^{-6} is slightly above the most stringent end of the CalEPA's risk management range which is generally acceptable for occupational-related exposures. Considering the planned redevelopment of the Site includes a new large commercial building, a lower attenuation factor than the conservative AF of 0.03 would be expected. The soil vapor to indoor air AF for a future commercial building of 0.0005 is a less conservative, while protective, bound for risk-based decisions for the Site. The HHRA indicates that vinyl chloride accounts for approximately 90-percent of the total excess cancer risk. Based on the results of the 2020 and 2021 subslab vapor, indoor air, and soil vapor sampling events, vinyl chloride was detected in soil vapor samples collected at 5 feet bgs but was not detected in subslab vapor or indoor air samples. The absence of vinyl chloride in the subslab vapor samples indicates that vinyl chloride attenuates in the shallow subsurface due to processes such as aerobic degradation. As a result, the estimated vinyl chloride concentrations in indoor air assuming an AF of 0.03 or 0.0005 are conservative and the associated estimated risks are likely overestimated.

A vapor intrusion mitigation system for the new commercial building is planned to reduce the potential for unacceptable exposures. Design plans for the system were included with the HHRA for DTSC review (RMD, 2021b).

3.0 PROJECT CONTACTS, RESPONSIBILITIES, AND NOTIFICATIONS

3.1 Project Contacts and Responsibilities

Prior to the initiation of activities that are covered by this SGMP, the Property Owner will confirm the contact information for the representatives for the Regulatory Oversight Agency, Environmental Consultant, and General Contractor listed below. The General Contractor will be determined on a project-specific basis. It is the responsibility of the Property Owner's representatives to adhere to this SGMP, which includes notification procedures related to regulatory oversight agency, underground utility clearance, permitting, health and safety, and existing monitoring well network as described in Sections 3.2 through 3.6. The following table lists the Property Owner's representatives at the time of publication of this SGMP:

Project Role	Company Name	Representative Name	Contact Information
Property Owner	Leandro Brookshire	Brett Richer Environmental	415-733-9574 bricher@prologis.com
		Cory Chung Construction	510-661-4002 cchung@prologis.com
Regulatory Oversight Agency	DTSC	Yongsheng (Johnny) Sun	510-540-3872 yongsheng.sun@dtsc.ca.gov
Environmental Consultant	RMD	Khaled Rahman	510-561-8810 krahman@rmdes.net
General Contractor	Project-Specific To Be Determined	Project-Specific To Be Determined	Project-Specific To Be Determined

The responsibilities of the Property Owner's representatives listed above are described in the following sections.

3.1.1 Property Owner

The Property Owner means Leandro Brookshire and/or its successors and assigns in interest, who hold title to all or any portion of the Site. The Property Owner or its designee is responsible for

ensuring that the General Contractor, Environmental Consultant, and other subcontractors adhere to the requirements of the SGMP. The Property Owner will provide an electronic copy and access to a hard copy of the SGMP to contractors that are performing redevelopment activities at the Site.

3.1.2 Regulatory Oversight Agency

The regulatory oversight agency provides review of environmental investigations and cleanup actions at the Site. A record of environmental conditions at the Site (i.e., regulatory directives and correspondence, Site documents, and analytical data) may be obtained through a review of the case files at the DTSC EnviroStor website https://www.envirostor.dtsc.ca.gov/public/ (EnviroStor ID No. 01990015).

3.1.3 Environmental Consultant

As needed, the Environmental Consultant or its designee will be available to assist the Property Owner, General Contractor, and subcontractors with the implementation of this SGMP and proper handling and storage of impacted and potentially impacted soil and groundwater, which may be encountered during redevelopment activities.

3.1.4 General Contractor

The General Contractor or its designee is responsible for providing the material, labor, equipment and services necessary for the construction of the project. A general contractor often hires specialized subcontractors to perform all or portions of the construction work. When using subcontractors, the General Contractor is responsible for ensuring that subcontractors adhere to the requirements of the SGMP.

3.2 Agency Notifications

The notification of outside agencies may be required during redevelopment activities. Prior to the initiation of redevelopment activities that are covered under this SGMP, the Property Owner will confirm the contact information provided below and update as necessary.

Conditions Posing an Immediate Threat. For life-threatening or serious hazardous materials incidents, the following number will be contacted immediately upon discovery.	
Local police, fire and rescue services	911
Certified Unified Program Agency (CUPA). For administrative requirements, permits, inspections, and enforcement activities associated with the regulation of hazardous materials and hazardous wastes in the City of San Leandro, the following number will be contacted.	
San Leandro Environmental Services Section (SLESS)	(510) 577-3401 (non-emergency)

Releases to Water. For spills or releases of hazardous substances or petroleum hydrocarbons to surface water, the following agencies will be contacted immediately upon discovery.	
National Spill Response Center	(800) 424-8802
United States Coast Guard – San Francisco Sector (if spill is going to reach navigable waters)	(415) 399-3547
California Office of Emergency Services	(800) 852-7550; (916) 845-8911
San Francisco Bay Regional Water Quality Control Board	(510) 622-2300
Local Emergency Response Agency	911
VOC-Impacted Soil. If VOC-impacted soil is discovered during redevelopment activities, the following agencies will be notified.*	
Bay Area Air Quality Management District (BAAQMD)	(415) 749-4990
* BAAQMD Regulation 8, Rule 40, Section 301 exempts from control the aeration of soil containing less than 50 parts per million by weight (ppmw) of organic compounds, but Section 403 still requires reporting of any soil aeration[1]. Notification form (Appendix D) postmarked or faxed at least five days prior to commencement of any removal or excavation activity of VOC-impacted soil.	
Department of Toxic Substances Control	(510) 540-3872
Dust Complaints. For dust complaints during redevelopment activities, the following agencies will be notified.	
BAAQMD	(415) 749-4990

3.3 Utility Clearance

To survey for potential underground utilities, the General Contractor, Environmental Consultant, or their designee will mark the locations where ground is to be disturbed and contact Underground Service Alert (USA) at least 48 hours (2 work days) prior to commencing any excavation work. USA will contact utility partners to locate and mark their conduits.

3.4 Permitting

If necessary, permits will be obtained prior to conducting redevelopment activities covered by this SGMP. The permits will be kept onsite and made available for inspection during work hours.

3.5 Health and Safety Plan

Redevelopment activities will be completed with safety as the foremost concern to minimize the potential for accidents, injuries, contaminant exposures, and or illnesses. A Site HASP will be prepared by the General Contractor for the redevelopment project in accordance with Federal and

[1] As defined by BAAQMD Regulation 8, Rule 40, Section 202, aeration is the exposure of excavated soil containing volatile organic compounds to the air.

State Occupational Safety and Health Administration (OSHA) standards for hazardous waste operations (29 Code of Federal Regulations [CFR] 1910.1208 and 8 California Code of Regulations [CCR] 5192, respectively). Subcontractors may either adopt the General Contractor's HASP or prepare their own HASP. The General Contractor is responsible for verifying that onsite workers and visitors have read and will adhere to the procedures established in the HASP. A copy of the HASP will be kept onsite during redevelopment activities. In the event that unanticipated conditions occur at the Site, the General Contractor is responsible for modifying the HASP accordingly.

Onsite workers handling or conducting intrusive work that may encounter impacted soil or groundwater will be trained in accordance with OSHA regulations for hazardous waste operations (29 CFR 1910.120(e) and 8 CCR 5192), which state that "general site workers" shall receive a minimum of 40 hours of classroom training and a minimum of three days of field training. This training provides precautions and protective measures to reduce or eliminate hazardous materials/waste hazards at the work place.

3.6 Groundwater Well Network Protection

The onsite groundwater well network consists of approximately 23 A-zone wells and 29 B-zone wells that are part of the groundwater monitoring program (Figure 3). Well construction details are summarized in Table 1.

A November 19, 2020 *Redevelopment-Related Groundwater Monitoring Well Network Modification Work Plan* (RMD, 2020c), which was approved in a June 2, 2021 DTSC letter, was prepared to reduce the potential for damaged or lost wells during redevelopment. Based on available redevelopment plans, the monitoring wells were designated for either:

- Protection in areas where minimal grade changes are anticipated. These monitoring wells will be marked with paint and/or installation of delineators/snow fencing/bollards. The General Contractor will protect these groundwater monitoring wells and maintain access to the wells for routine monitoring to the extent practicable; or
- Destruction in areas within the building footprint and areas with significant grade changes. Although the need for replacement will be evaluated, we anticipated that most of these wells will be reinstalled following completion of redevelopment activities.

DTSC will be notified of changes to these designations based on modifications to the redevelopment plans and/or input from the General Contractor with rationale for wells that do not warrant replacement. Prior to removal or installation of any wells, permits will be acquired from the Alameda County Public Works Agency (ACPWA).

4.0 SOIL MANAGEMENT

This section outlines the general soil management procedures that shall be implemented by parties involved in redevelopment activities at the Site, including the areas identified in the LUC (i.e., near well MW-3 and boring CB-28, Figure 3). Soil management and handling activities will be conducted in accordance with applicable federal, state, and local regulations. Contingency measures for discovery of unexpected underground structures including tanks, vaults, sumps, containment structures, separators, or piping are presented in Section 5.0.

4.1 Field Screening and Soil Categorization

4.1.1 Field Screening

Soil will be excavated in accordance with the grading plan for the Site. Although remediation activities have reduced the TCE concentrations in the subsurface, residual CVOC concentrations may be encountered during ground disturbing activities, particularly near the suspected former release areas. The General Contractor will be instructed to report indicators of potentially impacted soil. The primary physical indicators of soil impacted with volatile organics include the following:

- Staining: Organic contaminants may cause staining.
- Odor: Soil impacted with volatile organics and other types of contamination may release vapors when exposed to the atmosphere, which can be interpreted as an odor.

The General Contractor will also be instructed to report indicators of petroleum-related contamination, which include the following:

- Staining: Gray, black or green staining.
- Sheen: Shiny and reflective sheen. Sheens from heavily impacted soil may appear iridescent with rainbow-like colors.
- Odor: Petroleum-like odor.

Odor can be subjective, and inhalation of vapors from impacted soil may be harmful to human health. Therefore, odor is considered an unreliable field indicator and should not be used for continuous screening of soil. Field screening of soil will be conducted continuously during ground disturbing activities using a calibrated handheld photoionization detector (PID) or other organic vapor meter. Field screening using a PID will be conducted by properly trained General Contractor and/or Environmental Consultant personnel.

4.1.2 Soil Categorization

Based on the field screening, excavated soil will be segregated into stockpiles in three categories:

- Background Soil: No visual and odor indicators, and PID measurements that are consistent with background levels. PID readings of up to 5 parts per million by volume (ppmv) will be considered background levels. These soils will be characterized for onsite reuse.
- Interim Soil: No visual and odor indicators, and PID measurements between 5 ppmv and 50 ppmv. These soils will be characterized for onsite reuse. If initial findings indicate that this category does not meet onsite soil reuse criteria (see Section 4.2), these soils may be characterized for offsite disposal.
- Contaminated Soil: Staining and odor indicators present, and/or PID measurements of more than 50 ppmv[2]. These soils will be further evaluated and are likely to be characterized for offsite disposal (see Section 4.3).

General stockpile management is described in Section 8.

4.1.3 De Minimis Soil

Soil produced during the following activities are considered de minimis:

- Trenching during utility line installation, and similar projects; and
- Small excavations during landscaping, fence/sign post installation, and similar projects.

These soils will be field screened and reused to backfill the excavation from which they originated without sampling and laboratory analysis unless categorized as Contaminated Soil. Contaminated Soil and excess soil, if any, will be segregated and stockpiled based on field screening results.

4.2 Onsite Soil Reuse

As mentioned above, a vapor intrusion mitigation system is planned for installation beneath the new commercial building footprint. Other areas of the Site will be used for outdoor parking and loading. These conditions indicate that exposure pathways to COPCs in the subsurface will be managed or incomplete.

[2] As defined by BAAQMD Regulation 8, Rule 40, Section 205, contaminated soil has an organic content exceeding 50 parts per million by weight (ppmw) as measured using an appropriate laboratory analysis or registers an organic concentration greater than 50 ppmv as measured at a distance of three inches from the surface of the soil with an organic vapor analyzer.

Based on field screening, de minimis soil may be reused to backfill the excavation of origination. Background and interim soil stockpiles will be sampled to evaluate onsite reuse in general accordance with the DTSC *Information Advisory Clean Imported Fill Material*, dated October 2001 (Appendix E).

For onsite soil reuse, a limited set of laboratory analyses are planned:

- VOCs by USEPA Method 8260B (with collection by USEPA Method 5035).

For excavated and stockpiled import material, the following sampling frequency will be used:

- Up to 1,000 cubic yards – one sample per 250 cubic yards.
- 1,000 to 5,000 cubic yards – 4 samples for the first 1,000 cubic yards plus one sample per each additional 500 cubic yards.
- Greater than 5,000 cubic yards – 12 samples for the first 5,000 cubic yards plus 1 sample per each additional 1,000 cubic yards.

The analytical results of the import soil samples will be compared to applicable screening criteria to evaluate whether the material is suitable for reuse at the Site. Applicable screening criteria will include DTSC soil SLs[3] for direct exposure for commercial/industrial land use.

4.3 Response Measures for Discovery of Potentially Impacted Soil

If soil exhibiting evidence of contamination (e.g., visual and odor indicators, and PID measurements of more than 50 ppmv), is encountered during ground disturbing activities, the General Contractor will cease ground disturbing activities in the area and delineate the area with barricades or fencing, stakes and plastic sheeting as appropriate, and signage to notify onsite workers and visitors of access restrictions. The General Contractor will notify the Property Owner and Environmental Consultant. Upon notification, the Environmental Consultant will implement and/or provide oversight for the response measures described in the following sections.

4.3.1 Preliminary Assessment of Potentially Impacted Soil

Preliminary assessment of the potentially impacted soil will include confirmation that access control measures installed by the General Contractor are adequate to provide necessary protection to onsite workers and visitors. Air monitoring will be conducted by the Environmental Consultant around the perimeter of the delineated area using a PID to measure organic vapors in the breathing zone. The air monitoring results will be used to adjust the delineated area to provide necessary

[3] In order of priority, the SLs are currently available DTSC-modified SLs followed by USEPA RSLs.

protection to onsite workers and visitors. Additional engineering controls (i.e., dust and vapor mitigation and working upwind of the area) and personal protective equipment (PPE) may be required in order to work within the delineated area.

The Environmental Consultant will conduct this preliminary assessment using PID measurements to determine if field observations suggest that the potentially impacted soil are de minimis (i.e., consistent with background levels) or may be a significant risk to human health or the environment (e.g., consistent with the BAAQMD contaminated soil definition).

If field observations (e.g., visual and odor indicators) and PID measurements are consistent with background levels, the suspect conditions will be considered de minimis and the Environmental Consultant will release the delineated area to the General Contractor. If field observations indicate additional evaluation is warranted, ground-disturbing activities will not resume in the area until the procedures discussed in the following section are implemented.

4.3.2 Evaluation of Potentially Impacted Soil

If conditions in the delineated area are not considered de minimis, the Environmental Consultant will evaluate the potentially impacted soil in accordance with the protocols below.

- Soil Segregation: Soil samples will be collected using a pre-cleaned hand trowel or drive sampler, transferred into plastic Ziploc bag and observed for evidence of odors and staining and screened for volatile organics using a PID. PID measurements will be used to further segregate soil into de minimis, interim, and contaminated stockpiles.
- Stockpiled Soil Samples: For the contaminated stockpile, four discrete samples will be collected and composited by the laboratory for every 250 cubic yards of material or in accordance with the requirements of the disposal/accepting facility requirements.
- Sample Handling and Laboratory Analysis: Soil samples will be analyzed for VOCs by USEPA Method 8260B, and may be analyzed for TPHg, TPHd, and TPHmo by modified USEPA Method 8015, Title 22 metals by USEPA Method 6010B/7470 and other constituents as determined by the Environmental Consultant or as part of waste characterization testing for offsite disposal. If necessary, waste extraction test [WET] and/or toxicity characteristic leaching procedure [TCLP] will be conducted to determine if the soil exhibits hazardous characteristics.

Based on the evaluation, options for onsite reuse, or offsite disposal of the affected soil will be developed. After the evaluation is completed, the Environmental Consultant will provide the

Property Owner, General Contractor, and DTSC with a summary of findings in the *Construction Completion Report* (Section 10.0).

4.4 Soil Sampling

Discrete samples will be collected using EnCore or Terra Core samplers[4] for samples to be analyzed for VOCs. In addition, composite samples will be collected using a pre-cleaned hand trowel and transferred into laboratory-supplied glass containers or drive sampler equipped with stainless steel or brass liners that will be sealed with Teflon tape and capped.

Following soil sample collection, the containers will be labeled for identification and immediately placed in a chilled, thermally-insulated cooler containing bagged ice or blue ice. The cooler containing the samples will then be delivered under chain of-custody protocol to a state-certified laboratory.

4.5 Stockpile Management

Stockpile handling procedures and control measures are discussed in Section 8.1.

4.6 Dust Control Measures

As necessary, dust control measures shall be used during excavation, soil segregation, soil stockpiling, transport, and compaction activities to prevent or control surface and air movement of dust from disturbed soil surfaces. Dust control measures are discussed in Section 6.0.

4.7 Decontamination

Decontamination procedures for construction equipment and personnel shall be developed and followed to minimize residual contamination from leaving the Site during redevelopment activities. Decontamination procedures are discussed in Section 8.4.

4.8 Soil Importation

If additional fill is imported, the following procedures will be followed for use at the Site. Unless from a documented clean source, soil samples will be collected from the import source for characterization to ensure that soil imported onto the Site is not contaminated. Import fill material will be sampled in accordance with the DTSC *Information Advisory Clean Imported Fill Material*,

[4] U.S. Environmental Protection Agency (USEPA) Method 5035 will be used to minimize VOC loss.

dated October 2001 (Appendix E) for specific laboratory analyses based on the fill source characteristics, as follows:

- TPHg, TPHd, and TPHmo by modified USEPA Method 8015;
- VOCs by USEPA Method 8260B (with collection by USEPA Method 5035);
- Semi-Volatile Organic Compounds (SVOCs) by USEPA Method 8270C;
- Title 22 Metals by USEPA Method 6010B and 7471A;
- Polychlorinated Biphenyls (PCBs) by USEPA Method 8082;
- Asbestos by California Air Resources Board Method 435 (CARB); and
- Organochlorine Pesticides (OCPs) by USEPA Method 8081 and chlorinated herbicides by USEPA Method 8151 (for fill source areas formerly used as agricultural land);

For in-place import material, the following sampling frequency is required:

- Two acres or less – a minimum of four samples.
- Two to four acres – a minimum of one sample per 1/2 acre.
- Four to 10 acres - a minimum of eight samples.
- Greater than 10 acres- a minimum of eight locations with four subsamples per location.

For excavated and stockpiled import material, the following sampling frequency is required:

- Up to 1,000 cubic yards – one sample per 250 cubic yards.
- 1,000 to 5,000 cubic yards – 4 samples for the first 1,000 cubic yards plus one sample per each additional 500 cubic yards.
- Greater than 5,000 cubic yards – 12 samples for the first 5,000 cubic yards plus 1 sample per each additional 1,000 cubic yards.

If the chemical properties of an import fill source are verified through documentation, sampling may not be required. Depending on the former land use of the import fill source, additional sampling and analyses than described above may be necessary to properly characterize import fill. The analytical results of the import soil samples will be compared to applicable screening criteria to evaluate whether the material is suitable for import to the Site. Applicable screening criteria will include DTSC soil SLs for direct exposure for commercial/industrial land use and acceptable background levels for metals. Import soil with visual or olfactory evidence of petroleum hydrocarbons is prohibited.

4.9 Concrete Reuse

In an effort to reduce impacts to the neighboring community and minimize carbon emissions from trucking, onsite reuse of concrete and asphalt produced during demolition of the current buildings and pavement is planned. Concrete will be crushed onsite and reused as fill material. Asphalt will be incorporated into new pavement surfaces.

4.10 Backfilling

Portions of the Site will be backfilled in accordance with the grading plan for the Site. A plastic liner will be placed to demarcate the contact between fill material and native soil.

5.0 CONTINGENCY MEASURES FOR DISCOVERY OF UNEXPECTED UNDERGROUND STRUCTURES

In the event USTs or other buried structures are unexpectedly encountered during redevelopment activities, the following procedures will be followed. USTs may be identified during redevelopment activities by the presence of vent pipes that extend above the ground surface, product distribution piping that leads to the UST, fill pipes, backfill materials, or the underground structure itself. Other buried structures may not have features that extend above ground surface and could be discovered only after exposed by construction equipment. Discovered structures will be assessed as follows:

5.1 Initial Response

If unexpected underground structures, including tanks, vaults, sumps, containment structures, separators, or piping, that has previously contained or has the potential to contain hazardous materials are encountered during redevelopment activities, the General Contractor will notify the Property Owner and the Environmental Consultant within 24 hours of initial discovery. Upon notification, the Environmental Consultant will notify the DTSC and the SLESS, which is designated as the Certified Unified Program Agency (CUPA). The CUPA consolidates, coordinates, and makes consistent the administrative requirements, permits, inspections, and enforcement activities associated with the regulation of hazardous materials and hazardous wastes in the City of San Leandro through various programs. The DTSC and the SLESS will be consulted regarding appropriate next steps.

In accordance with the Site HASP, appropriate measures will be implemented to ensure worker safety in areas where unexpected conditions are encountered. The General Contractor or designated Health and Safety Officer will be responsible for evaluating any change in Site conditions and may stop work to determine if the level of Site security and PPE is adequate. If warranted, the area where the unexpected condition is encountered will be secured with barricades or fencing, and plastic sheeting as appropriate, and signage will be installed to prevent unauthorized access to the area.

5.2 Assessment of Discovered Underground Structures

Discovered underground structures will be assessed as follows:

- The structure will be inspected to assess whether it contains any indication of chemical residuals or free-phase liquids other than water. This assessment will be conducted by the Environmental Consultant and will be based on visual evidence and the results of vapor

monitoring using a PID. Under no circumstances will any personnel enter an unknown subsurface structure at any time;

- If chemicals are not indicated within the structure by the above-referenced means, and with DTSC and SLESS approval, the structure may be removed or abandoned in place in a safe manner by an experienced and licensed contractor. If warranted, permits will be obtained from the SLESS prior to removing the underground structure;
- If liquids or solids are present within the structure, measures will be taken to contain the liquids to avoid spills to the subsurface. Liquids will be contained either in the structure or, if leaking, via spill control methods such as absorbent material and pumping to a storage tank. Samples of the liquid will be collected and submitted to a state-certified laboratory for analysis as determined by the Environmental Consultant or as part of waste characterization testing for offsite disposal. Based on analytical results, the liquids or solids will be disposed of in accordance with applicable environmental laws and disposal requirements;
- If contaminated liquid or solids are present in the structure, the structure will be inspected for physical integrity following removal of the contaminated media. The Environmental Consultant will document the results of this inspection, including an estimation of the volume and former use of the structure;
- If the physical inspection of the structure suggests that chemicals may have been released to the underlying soil, additional environmental sampling will be conducted to assess whether over-excavation is warranted;
    - If, based on the opinion of the Environmental Consultant, DTSC, and SLESS, it is assessed that the structure is intact, that subsurface releases of the chemicals to the underlying soils likely did not occur, and no free-phase liquids or chemical residues remain inside, removal of the structure may not be required for environmental reasons.
    - Otherwise, with DTSC and SLESS approval, the structure will be removed and disposed of in accordance with applicable environmental laws and disposal requirements. Once the structure is removed, soil adjacent to and beneath the structure will be assessed for contamination through visual observation and PID response and the results documented. If soil is considered "contaminated soil" as defined by the BAAQMD, the appropriate response will be determined in consultation with the DTSC and SLESS.

6.0 EROSION, DUST, AND ODOR MANAGEMENT

Once the pre-construction ground surface is stripped from the Site, the exposed soil will become susceptible to erosion by wind and water. Depending on soil and weather conditions, airborne dust and fugitive emissions may be produced. Therefore, erosion control measures and dust control measures will be established before construction begins. Emission (dust) control measures will, at a minimum, comply with those established by OSHA and the BAAQMD for construction-related activities. Dust control measures will be based on "Best Management Practices" (BMPs) and will be used throughout the phases of redevelopment. Standard dust and fugitive emissions control measures will be followed during the redevelopment activities to accomplish the following goals:

- Reduce the potential for health impacts to onsite workers and visitors;
- Reduce the potential for health impacts to offsite receptors;
- Prevent violations of ambient air quality standards;
- Minimize nuisance dust complaints from offsite receptors; and
- Minimize the migration of contaminants adhered to fugitive dust particles outside the Site.

6.1 Construction Mitigation Measures

The following basic construction mitigation measures will be implemented in accordance with recommendations in the BAAQMD *California Environmental Quality Act Air Quality Guidelines* (BAAQMD, 2017):

- Exposed surfaces (e.g., parking areas, staging areas, graded areas, and unpaved access roads) will be watered two times per day, weather dependent. Alternately, soil binders can be applied in areas that will remain unused;
- Haul trucks transporting soil or other loose material offsite will be covered;
- Prior to entering public roads, visible loose soil will be removed from the vehicle exterior using dry methods (e.g., shovels and stiff-bristled brooms or brushes). If visible mud or dirt is tracked-out onto adjacent public roads, a wet power vacuum street sweeper will be used. The use of dry power sweeping is prohibited;
- Vehicle speeds on unpaved roads will be limited to 15 miles per hour (mph);
- Roadways, driveways, and sidewalks to be paved will be completed as soon as possible. Building pads will be laid as soon as possible after grading unless seeding or soil binders are used;

- Idling times will be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California airborne toxics control measure 13 CCR 2485). Clear signage will be provided for construction workers at all access points;
- Construction equipment will be maintained and properly tuned in accordance with manufacturer's specifications. Equipment will be checked by a certified mechanic and determined to be running in proper condition prior to operation; and
- A publicly visible sign that includes the General Contractors name and telephone number to contact regarding dust complaints will be posted. When contacted, the General Contractor will respond and take corrective action within 48 hours. The BAAQMD's phone number will also be visible to ensure compliance with applicable regulations.

6.2 Dust Suppression Measures

If dust is excessive, one or more of the following mitigation measures may be implemented:

- Apply water or (non-toxic) soil stabilizers to unpaved access roads, parking areas, and staging areas;
- Sweep (with wet power sweepers) paved access roads, parking areas, and staging areas;
- Cover or otherwise stabilize exposed soil stockpiles; and
- Suspend redevelopment activities that cause visible dust plumes and odors to extend beyond the limits of the Site.

6.3 Contingency Measures for Odor and Vapor Suppression

By controlling the dust as described above, the emission of odor and vapors will be reduced to levels that likely will not pose a risk to the health of the onsite workers and visitors. The water spray used to control dust will also significantly reduce the emissions of any potential volatiles that may be present in the soil. The selective loading and transportation of impacted soils could minimize the use of soil stockpiling, further reducing potential emissions of volatiles. Any active stockpile of contaminated soil will be properly covered with plastic so emissions of volatiles will be minimized.

If odor is excessive and vapor emissions are detected, one or more of the following contingency measures may be implemented:

- Apply water or water containing a non-toxic biodegradable deodorizer, odor suppressing foam, or other odor mitigation agents to exposed soil using various applications such as spray or mist;

- Alternative work sequencing, such that excavation of soil with potential odor during mid-day or afternoon (during hot weather) is avoided;
- Any highly odorous soil could be segregated and placed inside a roll-off bin equipped with a lid. This will minimize the amount of highly odorous soil handling; and
- Balancing the excavation with transportation so that the need for large stockpiles is reduced.

The equipment proposed for the Site redevelopment will be maintained properly so that exhaust emissions will be within acceptable standards. The General Contractor will notify the Property Owner of complaints, if any, and record any corrective actions implemented to control odors or vapors in a daily field log.

7.0 GROUNDWATER MANAGEMENT

The depth to groundwater at the Site is typically encountered at depths of approximately 5 to 7 feet bgs. In general, construction worker receptors will be performing activities consistent with this SGMP and a Site HASP. The HASP will require the use of proper PPE and the BMPs will require dewatering to preclude any direct contact with groundwater for workers at the Site.

Construction dewatering effluent, if produced, shall be pumped into holding tanks or United Nations (UN)-rated 55-gallon drums with appropriate labeling and secondary containment. If dewatering effluent is to be discharged to the storm drain, a National Pollutant Discharge Elimination System (NPDES) permit will be obtained from the Regional Water Quality Control Board. If dewatering effluent is to be discharged to the San Leandro Water Pollution Control Plant, an industrial pre-treatment permit will be obtained from the SLESS.

Chemical analysis will be performed in accordance with the receiving facility's requirements prior to discharge. If concentrations exceed the limits established for the discharge point, the dewatering effluent will either be (1) transferred into a vacuum truck or properly labeled UN-rated 55-gallon drums and transported offsite for disposal at an appropriately-licensed disposal facility or (2) treated and discharged following sampling and analysis to confirm compliance with permit requirements.

The treatment system of the dewatering effluent would include a holding tank, sediment filters, and two carbon vessels to treat the effluent prior to storm drain or sanitary sewer discharge. The sizing of components will depend on the water volumes produced and Site logistics. A typical treatment system schematic is shown in Figure 6.

8.0 WASTE MANAGEMENT

8.1 Soil Stockpile Management

Soil that is placed in temporary stockpiles will be maintained to prevent runon/runoff and fugitive dust emissions. The soil stockpile will be covered with plastic sheeting and bermed to prevent (1) erosion or leaching of contaminants to underlying soil, (2) exposure to precipitation and wind, and (3) the runoff of potential contaminants to surrounding areas. Plastic sheeting that covers the soil stockpile will be secured using sand bags or equivalent. The perimeter berm will be constructed with hay bales, dimensional lumber, or other equivalent methods. Following removal, the soil stockpile area will be restored to a pre-stockpile condition. Residual plastic or debris will also be disposed of following stockpile removal.

If soil stockpiling of potentially impacted soil is to be performed, an appropriate stockpile location will be established and stockpiled soil will be placed on plastic sheeting. Stockpiled soil will be secured with a berm (bottom plastic sheeting will be lapped over the berm materials), covered to control dust, profiled, and appropriately managed as described in the following sections.

8.2 Offsite Disposal

Soil that is not suitable for reuse will be transported offsite for disposal at a facility that possesses a current permit to accept the produced soil. The following website can be consulted to determine permitted facilities:

- https://www2.calrecycle.ca.gov/SolidWaste/Site/Search

Prior to disposing soil at an appropriately-licensed disposal facility, soil samples will be collected from the potential excavation area or stockpiled for characterization based on the source characteristics and disposal facility requirements. These requirements will be confirmed by the General Contractor and coordinated with the proposed receiving facilities prior to initiating soil sampling.

8.3 Soil Handling, Loading, and Transporting Procedures

Following acceptance of the soil by an appropriately-licensed disposal facility, the soil will be loaded in licensed haul trucks (end-dumps or transfers) and transported offsite following appropriate California and Federal waste manifesting procedures. The General Contractor, on behalf of the Property Owner, will be responsible for tracking final soil dispositions. Shipments of waste will be

tracked with the appropriate bill of lading or waste manifests, which will be provided to the Property Owner following completion of the redevelopment activities.

Transportation equipment will be chosen to safely transport the expected volumes of soil, taking into consideration the types of roads to be traveled and their loading capacity. The appropriate bill of lading or waste manifest documentation will be provided by the General Contractor to truck drivers hauling the soil offsite. As each truck is filled, an inspection will be made to verify that the load is securely covered, to the extent practicable, and that the tires of the haul trucks are reasonably free of accumulated soil prior to leaving the Site. During loading, dust and odor emissions will be monitored and mitigated as necessary. During transportation, the hauling trucks will be equipped to fully cover soil and debris, such as with a heavy tarpaulin. A street sweeper will be made available, as needed, to keep the loading area clean. The soil will be wetted, as necessary, to reduce the potential for dust generation during loading and transportation activities.

Transportation activities will be performed in strict compliance with Federal, State, and County regulations and ordinances. Hauling contractor(s) used to transport soil will be fully licensed and permitted by the State of California. For hazardous waste haulers, the selected transportation company will be certified by the State of California as a hazardous waste hauler, and appropriately permitted to haul contaminated waste material. Department of Transportation (DOT) and California Highway Patrol (CHP) safety regulations will be strictly followed by both hazardous and non-hazardous waste haulers.

Transportation routes will be developed to minimize transporting the affected soil through residential areas. The affected soil will be transported via surface streets to the closest suitable freeway, which is Interstate 880. The proposed routes for transportation to Interstate 880 are as follows:

- To Interstate 880 North and South: Leaving the Site along Doolittle Drive, travel southeast approximately 0.25-miles to Davis Street. At Davis Street, make a left-hand turn. Travel east along Davis Street approximately 0.6 miles to the I-880 north and south ramps. Use the appropriate ramp to enter I-880.

The remainder of the freeway route(s) will be established upon selection of the appropriate offsite destination.

8.4 Decontamination Procedures

In order to prevent residual contamination from leaving the Site by construction equipment and personnel during redevelopment activities, the following decontamination procedures will be followed:

- Trucks used to transport soil will be loaded in a manner to minimize soil spillage and fugitive dust.
- To minimize the spread of contaminated soil, equipment will be cleaned prior to movement out of active work zones in impacted areas. The equipment wheels/tires will be cleaned by means of shovels and stiff-bristled brooms or brushes until they are fully cleaned. Upon completion of cleaning, any debris will be placed in the appropriate transportation vessel and the plastic sheeting will be disposed. Equipment exiting the Site will be inspected and logged for compliance with the Site decontamination requirements.
- Disposable PPE will be removed and properly discarded. The Site HASP will address decontamination of reusable PPE.

8.5 Wastewater and Groundwater Management

Wastewater produced during redevelopment activities, such as decontamination liquids, will be temporarily stored onsite. Decontamination water will be profiled and transported to an appropriate disposal or recycling facility.

If a saturated zone that produces accumulated water is encountered during redevelopment activities, groundwater management protocols as discussed in Section 7.0 will be followed.

8.6 Spill Response Plan

In the event of a spill, the General Contractor will be responsible and prepared to respond in a safe and efficient manner, specific to the particular spill situation. Consistent procedures will be used for handling of spills, whether they are onsite spills or spills occurring during transportation. Haulers will have an Emergency Spill Contingency Plan (ESCP) to ensure that drivers and dispatchers know their responsibilities in the unlikely event that an accidental spill occurs while transporting contaminated material offsite. The drivers and dispatchers will be required to know the procedures for emergency spill response. The ESCP will meet or exceed Federal, State, and County regulations currently in effect. The provisions of the ESCP will be strictly adhered to, in order to ensure continued protection of the public safety and the environment. The HASP will address the handling of onsite spills.

9.0 STORMWATER MANAGEMENT

Stormwater pollution controls shall be implemented by the General Contractor to minimize sediment runoff in stormwater. BMPs including grading the Site and installing stormwater control devices such as temporary earth berms or erecting silt fences around the perimeter of exposed soil at the Site, shall be implemented to prevent erosion and sediment runoff from the Site. Straw bale barriers or sediment traps are required to protect any existing catch basins or drainage channels. A separate stormwater pollution prevention plan (SWPPP) shall be provided by a Qualified SWPPP Developer (QSD) prior to beginning redevelopment activities.

10.0 WRITTEN RECORDS AND REPORTING

During redevelopment activities, soil and/or groundwater sampling, removal and management of discovered underground structures, chemical analysis and proper disposal of contaminated materials, and soil import activities will be documented in a daily field log by the General Contractor and/or Environmental Consultant. At the completion of the redevelopment activities, a *Construction Completion Report* will be prepared by the Environmental Consultant for submittal to DTSC that summarizes the soil and groundwater handling activities. The report will include at a minimum the following, as applicable:

- Impacted Soil – origin, volume, characterization, and destination (disposed of offsite);
- Discovered Underground Structures – type, contents, characterization, and destination (abandoned in place or disposed of offsite);
- Dust Complaint Logs – time, name and contact information, complaint description, and measures taken to mitigate dust;
- Groundwater – volume of groundwater that is removed, characterization, treatment, and destination (used as dust suppression or disposed of offsite);
- Offsite Disposal Records – date, time, vehicles used for the trip, volume/weight, copies of bills-of-lading, and waste manifests;
- Imported Soil – origin, volume, and characterization; and
- Analytical Reports – copies of laboratory analytical results.

12.0 LIMITATIONS

This document was prepared for the exclusive use of Leandro Brookshire LLC and DTSC for the express purpose of complying with DTSC requirements. This SGMP does not address issues related to other chemicals or media that may be encountered during construction or other activities including, but not limited to, demolition and construction debris, asphalt, concrete, asbestos-containing building materials, lead-based paint, or any chemicals brought onsite by workers. If such materials are encountered during a project, each Contractor is responsible for complying with all applicable laws pertaining to the handling and disposal of these materials.

This SGMP is based on current known Site conditions and current laws, policies, and regulations as of publication. RMD has used professional judgment to present the findings and opinions of a scientific and technical nature. The opinions expressed are based on the conditions of the Site existing at the time of the field investigation, current regulatory requirements, and any specified assumptions. The presented findings and recommendations in this report are intended to be taken in their entirety to assist Leandro Brookshire LLC and DTSC personnel in applying their own professional judgment in making decisions related to the Site. No warranty or guarantee, whether expressed or implied, is made with respect to the data or the reported findings, observations, conclusions, and recommendations.

COVENANT TO RESTRICT USE OF PROPERTY

ENVIRONMENTAL RESTRICTION

County of Alameda APNs 77A-741-4-2 and 77A-741-5, Former Kaiser Aerotech Site, DTSC site code number 200559

This Covenant and Agreement ("Covenant") is made by and between Redemco, L.L.C. (the "Covenantor"), the current owner of property situated in San Leandro, County of Alameda, State of California, described in Exhibit "A" and depicted in Exhibit "B," attached, (the "Property"), and the Department of Toxic Substances Control (the "Department"). Pursuant to Civil Code section 1471, the Department has determined that this Covenant is reasonably necessary to protect present or future human health or safety or the environment as a result of the presence on the land of hazardous materials as defined in Health and Safety Code section 25260. The Covenantor and Department, collectively referred to as the "Parties," hereby agree, pursuant to Civil Code section 1471, and Health and Safety Code section 25355.5 that the use of the Property be restricted as set forth in this Covenant; and the Parties further agree that the Covenant shall conform with the requirements of California Code of Regulations, title 22, section 67391.1.

* Recording fee waived per Gov't Code §27387

ARTICLE I
STATEMENT OF FACTS

1.01. The Property, totaling approximately 14 acres, is more particularly described as 880 Doolittle Drive and 498 Hester Street in the City of San Leandro, County of Alameda, California, and is depicted in the attached Exhibits "A" and "B". The Property is located in the area now generally bounded by Doolittle Drive on the west, Hester Street on the north and Davis Street on the south. The Property is also described as Alameda County Assessor's Parcel Numbers 77A-741-4-2 and 77A-741-5.

1.02. A limited portion of the Property is more particularly described in Exhibit "C," and referred to as the Ground Water Monitoring System. The Ground Water Monitoring System consists of groundwater monitoring wells located throughout the entire Property.

1.03. Covenantor is remediating the Property under the supervision and authority of the Department. The Property is being remediated pursuant to a Remedial Action Plan developed in accordance with Health and Safety Code, division 20, chapter 6.8 under the oversight of the Department. The Remedial Action Plan (RAP) and notice of exemption, pursuant to the California Environmental Quality Act, Public Resources Code section 21000 et seq. were released for public review and comment and subsequently approved by the Department on February 26, 2008. A Covenant is required as part of the site remediation, because volatile organic compounds (VOCs), which are hazardous substances, as defined in Health and Safety Code section 25316, and hazardous materials as defined in Health and Safety Code section 25260, remain above unrestricted cleanup goals in groundwater and shallow soil below the surface of the property.

Remediation includes maintaining groundwater monitoring wells ("Monitoring Wells").

The locations of the Monitoring Wells are shown on Exhibit C. The operation and maintenance of the Monitoring Wells is being conducted pursuant to an Operation and Maintenance Plan approved by the Department on June 27, 2012.

1.04. Soil investigations identified contaminants at concentrations exceeding residential screening levels in limited areas of the Property. As detailed in the RAP, a limited portion of the subsurface soils within six feet of the surface of the Property, as more particularly described in Exhibit D, contain a hazardous substance (trichloroethene; TCE), as defined in Health and Safety Code section 25316. The maximum TCE concentration detected in soil within six feet of the surface was 1,100 µg/kg. This exceeds the Environmental Protection Agency Regional Screening Level for TCE in soil for residential use (910 µg/kg).

As detailed in the RAP, groundwater at the Property is found 5 to 7 feet below ground surface (bgs) and extends beyond 40 feet bgs. As of June, 2012, contaminants in the groundwater above their associated California Maximum Contaminant Levels (drinking water standards) are: TCE; cis-1,2-DCE; trans 1,2-DCE; 1,1-DCE; 1,1-DCA; 1,2-DCA; and vinyl chloride (VC).

The Department concluded that use of the Property as a residence, hospital, school for persons under the age of 21 or day care center would entail an unacceptable human health risk and exposure to and use of the groundwater presents an unacceptable threat to human health and safety. The Department further concluded that the Property, as remediated, and subject to the restrictions of this Covenant, does not present an unacceptable threat to human health or safety or the environment, if limited to commercial and industrial use and limited by the other Environmental Restrictions herein.

ARTICLE II
DEFINITIONS

2.01. Department. "Department" means the California Department of Toxic Substances Control and includes its successor agencies, if any.

2.02. Environmental Restrictions. "Environmental Restrictions" means all protective provisions, covenants, restrictions, prohibitions, and terms and conditions as set forth in any section of this Covenant.

2.03. Improvements. "Improvements" includes, but is not limited to: buildings, structures, roads, driveways, improved parking areas, wells, pipelines, or other utilities.

2.04. Lease. "Lease" means lease, rental agreement, or any other document that creates a right to use or occupy any portion of the Property.

2.05. Occupant. "Occupant" means Owners and any person or entity entitled by ownership, leasehold, or other legal relationship to the right to occupy any portion of the Property.

2.06. Owner. "Owner" means the Covenantor, and all successors in interest including heirs and assigns, who at any time hold title to all or any portion of the Property.

ARTICLE III
GENERAL PROVISIONS

3.01. Runs with the Land. This Covenant sets forth Environmental Restrictions that apply to and encumber the Property and every portion thereof no matter how it is improved, held, used, occupied, leased, sold, hypothecated, encumbered, or conveyed. This Covenant: (a) runs with the land pursuant to Health and Safety Code section

25355.5 and Civil Code section 1471; (b) inures to the benefit of and passes with each and every portion of the Property, (c) is for the benefit of, and is enforceable by the Department, and (d) is imposed upon the entire Property unless expressly stated as applicable only to a specific portion thereof.

3.02. Binding upon Owners/Occupants. Pursuant to the Health and Safety Code, this Covenant binds all owners of the Property, their heirs, successors, and assignees, and the agents, employees, and lessees of the owners, heirs, successors, and assignees. Pursuant to Civil Code section 1471, all successive owners of the Property are expressly bound hereby for the benefit of the Department.

3.03. Incorporation into Deeds and Leases. This Covenant shall be incorporated by reference in each and every deed and Lease for any portion of the Property.

3.04. Conveyance of Property. The Owner shall provide written notice to the Department not later than thirty (30) days after any conveyance of any ownership interest in the Property (excluding Leases, and mortgages, liens, and other non-possessory encumbrances). The written notice shall include the name and mailing address of the new owner of the Property and shall reference the site name and site code as listed on page one of this Covenant. The notice shall also include the Assessor's Parcel Number (APN) noted on page one. If the new owner's property has been assigned a different APN, each such APN that covers the Property must be provided. The Department shall not, by reason of this Covenant, have authority to approve, disapprove, or otherwise affect proposed conveyance, except as otherwise provided by law or by administrative order.

3.05. Costs of Administering the Covenant to be paid by Owner. The Department has already incurred and will in the future incur costs associated with the administration of this Covenant. Therefore, the Covenantor hereby covenants for the Covenantor and for all subsequent Owners that, pursuant to California Code of

Regulations, title 22, section 67391.1(h), the Owner agrees to pay the Department's reasonable administrative oversight costs in administering the Covenant.

ARTICLE IV
RESTRICTIONS AND REQUIREMENTS

4.01. Prohibited Uses. The Property shall not be used for any of the following purposes without advance written approval from the Department under Sections 6.01 and 6.02:

(a) A residence, including any mobile home or factory built housing, constructed or installed for use as residential human habitation.

(b) A hospital for humans.

(c) A public or private school for persons under 21 years of age.

(d) A day care center for children.

4.02. Soil Management.

(a) No activities that will disturb the soil at or below 2.5 feet below grade (e.g., excavation, grading, removal, trenching, filling, earth movement, mining, or drilling) shall be allowed in areas with identified exceedances of residential screening levels, as depicted by the shaded areas in Exhibit D on the Property without a Soil Management Plan approved by the Department in advance.

(b) Any contaminated soils, in areas with identified exceedances of residential screening levels as depicted by the shaded areas in Exhibit D, brought to the surface by grading, excavation, trenching or backfilling shall be managed in accordance with an approved Soil Management Plan and all other applicable provisions of state and federal law.

4.03. Prohibited Activities. The following activities shall not be conducted at the Property:

(a) Drilling for any water, oil, or gas without prior written approval by the Department.

(b) Extraction of groundwater except as approved by the Department.

4.04. Non-Interference with groundwater monitoring wells.

(a) The groundwater monitoring wells shall not be altered without prior written approval by the Department.

(b) All uses and development of the Property shall preserve the physical accessibility to and integrity of the groundwater monitoring wells unless otherwise approved in writing by the Department.

4.05. Access for Department. The Department shall have reasonable right of entry and access to the Property for inspection, monitoring, and other activities consistent with the purposes of this Covenant as deemed necessary by the Department in order to protect the public health or safety, or the environment.

4.06. Access for Implementing Operation and Maintenance. The entity or person responsible for implementing the Operation and Maintenance Plan shall have reasonable right of entry and access to the Property for the purpose of implementing the Operation and Maintenance Plan until the Department determines that no further Operation and Maintenance is required.

4.07. Inspection and Reporting Requirements. The Owner shall conduct an annual inspection of the Property verifying compliance with this Covenant, and shall submit an annual inspection report to the Department for its approval by January 31st of each year. The annual inspection report must include the dates, times, and names of those who conducted the inspection and reviewed the annual inspection report. It also shall describe how the observations were performed that were the basis for the

statements and conclusions in the annual inspection report (e.g., drive by, fly over, walk in, etc.). If violations are noted, the annual inspection report must detail the steps taken to return to compliance. If the Owner identifies any violations of this Covenant during the annual inspections or at any other time, the Owner must within 10 days of identifying the violation: determine the identity of the party in violation, send a letter advising the party of the violation of the Covenant, and demand that the violation ceases immediately. Additionally, copies of any correspondence related to the violation of this Covenant shall be sent to the Department within 10 days of its original transmission.

ARTICLE V
ENFORCEMENT

5.01. Enforcement. Failure of the Owner or Occupant to comply with this Covenant shall be grounds for the Department to require modification or removal of any Improvements constructed or placed upon any portion of the Property in violation of this Covenant. Violation of this Covenant, including but not limited to, failure to submit, or the submission of any false statement, record or report to the Department, shall be grounds for the Department to pursue administrative, civil, or criminal actions, as provided by law.

ARTICLE VI
VARIANCE, TERMINATION, AND TERM

6.01. Variance from Restriction. Any person may apply to the Department for a written variance from a restriction imposed by this Covenant. Such application shall be made in accordance with Health and Safety Code section 25223.

6.02 Removal of Restriction. Any person may apply to the Department to remove a restriction imposed by this Covenant. Such application shall be made in accordance with Health and Safety Code section 25224.

6.03 Term. Unless ended in accordance with paragraph 6.02, by law, or by the Department in the exercise of its discretion, this Covenant shall continue in effect in perpetuity.

ARTICLE VII
MISCELLANEOUS

7.01. No Dedication Intended. Nothing set forth in this Covenant shall be construed to be a gift or dedication, or offer of a gift or dedication, of the Property, or any portion thereof to the general public or anyone else for any purpose whatsoever.

7.02. Recordation. The Covenantor shall record this Covenant, with all referenced Exhibits, in the County of Alameda within thirty (30) days of the Covenantor's receipt of a fully executed original.

7.03. Notices. Whenever any person gives or serves any Notice ("Notice" as used herein includes any demand or other communication with respect to this Covenant), each such Notice shall be in writing and shall be deemed effective: (1) when delivered, if personally delivered to the person being served or to an officer of a corporate party being served, or (2) three (3) business days after deposit in the mail, if mailed by United States mail, postage paid, certified, return receipt requested:

To Owner:
Redemco LLC

Vail, Colorado 81657
Attention: Ann Becher-Smead

and

To Department:
Department of Toxic Substances Control
700 Heinz Avenue
Berkeley, California 94710
Attention: Nina Bacey, Project Manager

Any party may change its address or the individual to whose attention a Notice is to be

sent by giving written Notice in compliance with this paragraph.

7.04. Partial Invalidity. If this Covenant or any of its terms are determined by a court of competent jurisdiction to be invalid for any reason, the surviving portions of this Covenant shall remain in full force and effect as if such portion found invalid had not been included herein.

7.05. Statutory References. All statutory references include successor provisions.

7.06. Incorporation of Attachments. All attachments and exhibits to this Covenant are incorporated herein by reference.

IN WITNESS WHEREOF, the Parties execute this Covenant.

EXHIBIT "A"

Description

REAL PROPERTY in the City of San Leandro, County of Alameda, State of California, described as follows:

PARCEL 1:

A PORTION of that certain 28.866 acre tract of land described in the deed from C. R. Adams, et ux, to McGuire and Hester, a California corporation, dated December 22, 1954, recorded December 24, 1954 in book 7619 of Official Records of Alameda County, page 420, (AJ/117215) described as follows:

BEGIN at the eastern extremity of that certain curve having a radius of 20 feet, which connects the southeastern line of Adams Avenue, with the southwestern line of Hester Street; as said curve, avenue and street are shown on the map of "Tract 1606", filed October 11, 1955 in book 36 of Maps, page 63, in the office of the County Recorder of Alameda County; run then along said line of Hester Street and its direct production, southeasterly, as described in Parcel 1 of deed by McGuire and Hester, a corporation, to City of San Leandro, a municipal corporation, dated July 2, 1956, recorded July 5, 1956 in book 8080 of Official Records of Alameda County, page 11, (AL/70905), south 60° 14' 20" east 1356 feet; then continue along said line of Hester Street, southeasterly on the arc of a curve to the right, with a radius of 20 feet, tangent to the last mentioned course, 17.91 feet and southerly and southeasterly on the arc of a reverse curve to the left, with a radius of 60 feet, tangent to the last mentioned arc, 64.68 feet to the actual point of commencement; then continue on the arc of said curve to the left, having a radius of 60 feet, easterly, northeasterly and westerly, tangent to the last mentioned arc, a distance of 204.23 feet to a point on the exterior boundary line of the parcel of land described in the deed from McGuire and Hester, a California corporation, to Tara Development Company, a corporation, dated April 6, 1959, recorded April 13, 1959 in book 8992 of Official Records of Alameda County, page 317, (AQ/42551), said point being the western extremity of that certain course having a radius of 20 feet and an arc distance of 22.52 feet; then along the exterior boundary line of said last mentioned parcel of land, the two

following courses and distances: easterly and northeasterly along the arc of said curve having a radius of 20 feet to the left from a tangent which bears south 85° 43' 26" east, a distance of 22.52 feet; and then north 29° 45' 40" east, tangent to said last mentioned arc, 230.05 feet to a point on the northeastern line of said 28.866 acre tract of land; then along the exterior boundary line of said 28.866 acre tract of land, the five following courses and distances: south 60° 14' 20" east 572.97 feet to an angle point thereon, north 78° east 116.65 feet, then south 13° 07' 08" east 80 feet, south 78° west 421.78 feet and south 77° 33' west 344.14 feet until intersected by a line drawn south 12° 27' east from the actual point of commencement; and then along said line, so drawn, north 12° 27' west 177.96 feet to the actual point of commencement.

PARCEL 2:

A NON-EXCLUSIVE PERPETUAL EASEMENT AND RIGHT OF WAY for railway spur tracks and all reasonable uses connected therewith, including maintenance and operation of freight cars together with the right to grant said easement to the Southern Pacific Company, a corporation, and also a non-exclusive easement and right of way for drainage purposes, together with the right to grant said drainage easement to the City of San Leandro, a municipal corporation, appurtenant to and for the use of the owner or owners of Parcel 1 above described, and any subsequent subdivision or subdivisions thereof, described as follows:

A PORTION of that certain 28.866 acre tract of land described in the deed from C. R. Adams, et ux, to McGuire and Hester, a California corporation, dated December 22, 1954, recorded December 24, 1954 in book 7519 of Official Records of Alameda County, page 420, described as follows:

BEGIN at the southeastern corner of the parcel of land designated as Parcel 1 in the deed from Joseph P. Hester, a widower, to Utility Trailer Sales Company of San Francisco, Inc., a corporation, dated February 10, 1961, recorded February 14, 1961 on Reel 264, Image 854, (AS/18624) Alameda County Records; run then along the eastern boundary line thereof, north 12° 27' west 20 feet; then south 77° 33' west 348.68 feet; then westerly along the arc of a curve to the right, with a radius of 291.90 feet, tangent to the last mentioned course, 118.37 feet to a point on the northwestern boundary line of said Parcel 1 (AS/18624); then along said last mentioned line, south 29° 45' 40" west 7.26 feet to a point on the southwestern boundary line of said 28.866 acre

tract of land; then along the last mentioned line, south 55° 31' east 52.42 feet to a point on the southern boundary line of said 28.866 acre tract of land; and then along the last mentioned line, north 77° 33' east 432.92 feet to the point of beginning.

Parcel 3:

BEGINNING at the northeastern corner of the parcel of land conveyed by Gertrude A. McNamara, et al, to Robert L. Osborne by deed dated August 27, 1945, recorded September 12, 1945, in book 4773 of Official Records of Alameda County, page 365, and running thence along the northern line of said parcel of land south 78° west, 421.78 feet to an angle point therein; thence continuing along said northern line south 77° 33' west 777.06 feet to the northeastern line of the right of way, 60 feet wide of the Southern Pacific Company; thence along the last named line south 55° 31' east, 428.91 feet; thence north 77° 33' east, 82.13 feet; thence south 55° 31' east, 190.20 feet; thence north 77° 33' east, 698.582 feet to the eastern line of said parcel of land; and thence along the last named line north 13° 02' west, 449.01 feet to the point of beginning, containing 10 acres, more or less;

Parcel 4:

a non-exclusive, irrevocable easement for roadway and incidental purposes (including the installation, maintenance and removal of water lines) in favor of Kaiser Aerospace & Electronics Corporation, its tenants, servants, visitors and licensees, assignees and successors in interest, for all purposes connected with the use of the above described premises, and as appurtenant to the above described premises, over and upon the following described properties situate in the Township of Eden, County of Alameda, California, more particularly described as follows, to-wit:

PORTION of the tract of land conveyed by Gertrude A. McNamara, et al, to Robert L. Osborne by deed dated August 27, 1945, recorded September 12, 1945, in book 4773 of Official Records of Alameda County, California, page 365, described as follows:

Parcel A.

BEGINNING at a point on the northeastern line of Bay Shore Boulevard, or County Road No. 1434, distant thereon north 45° 04' west 1247.30 feet from the northwestern line of Davis Street, or County Road No. 1434; and running thence along

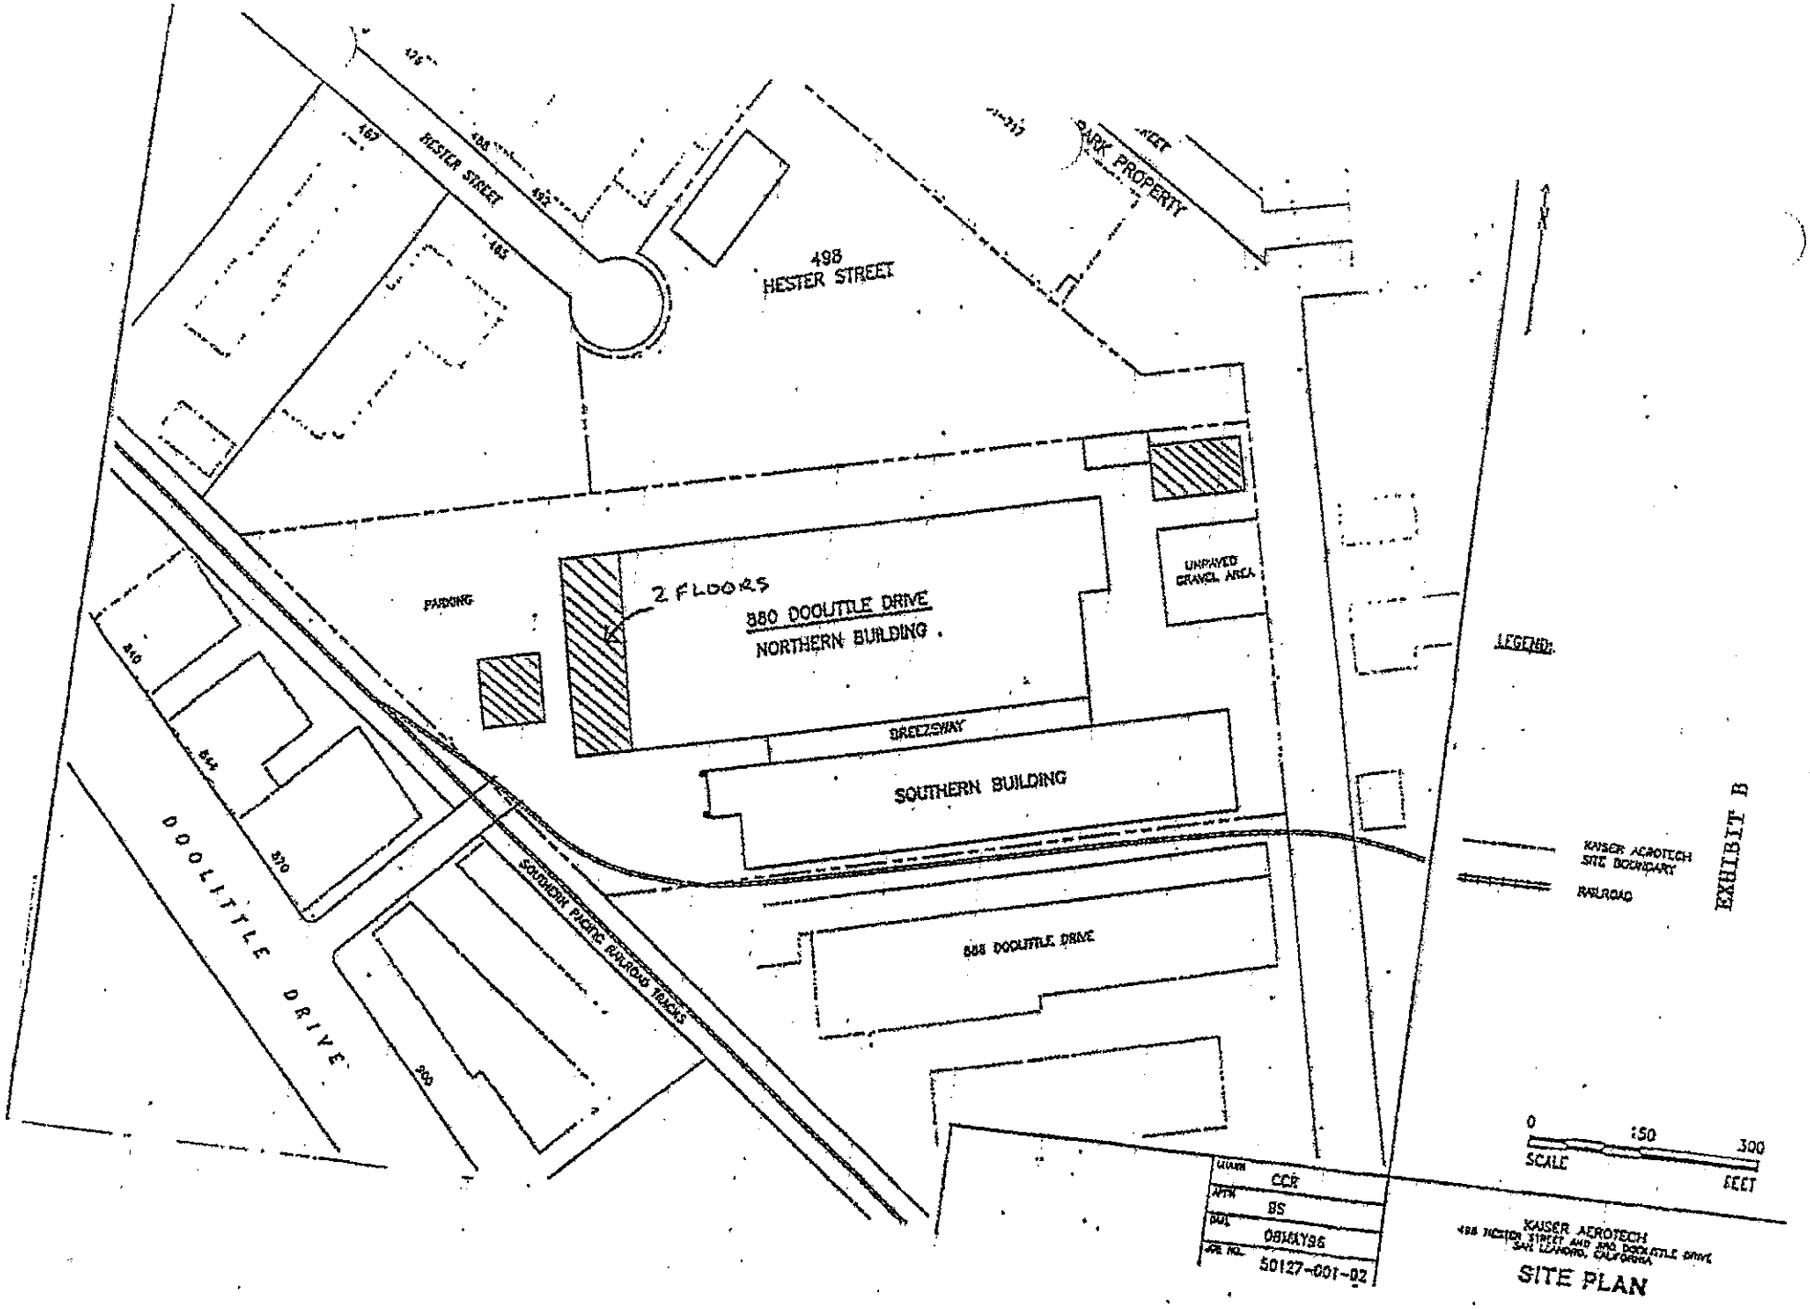
said line of Bay Shore Boulevard north 45° 04' west 40 feet to the northern line of said tract of land described in said deed; thence along the last named line north 44° 56' east 218.25 feet to the southwestern line of the right-of-way, 60 feet wide, of the Southern Pacific Company; thence along the last named line south 55° 31' east 40.67 feet to a line drawn north 44° 56' east from the point of beginning; and thence south 44° 56' west 225.63 feet to the point of beginning.

CONTAINING 0.203 of an acre, more or less.

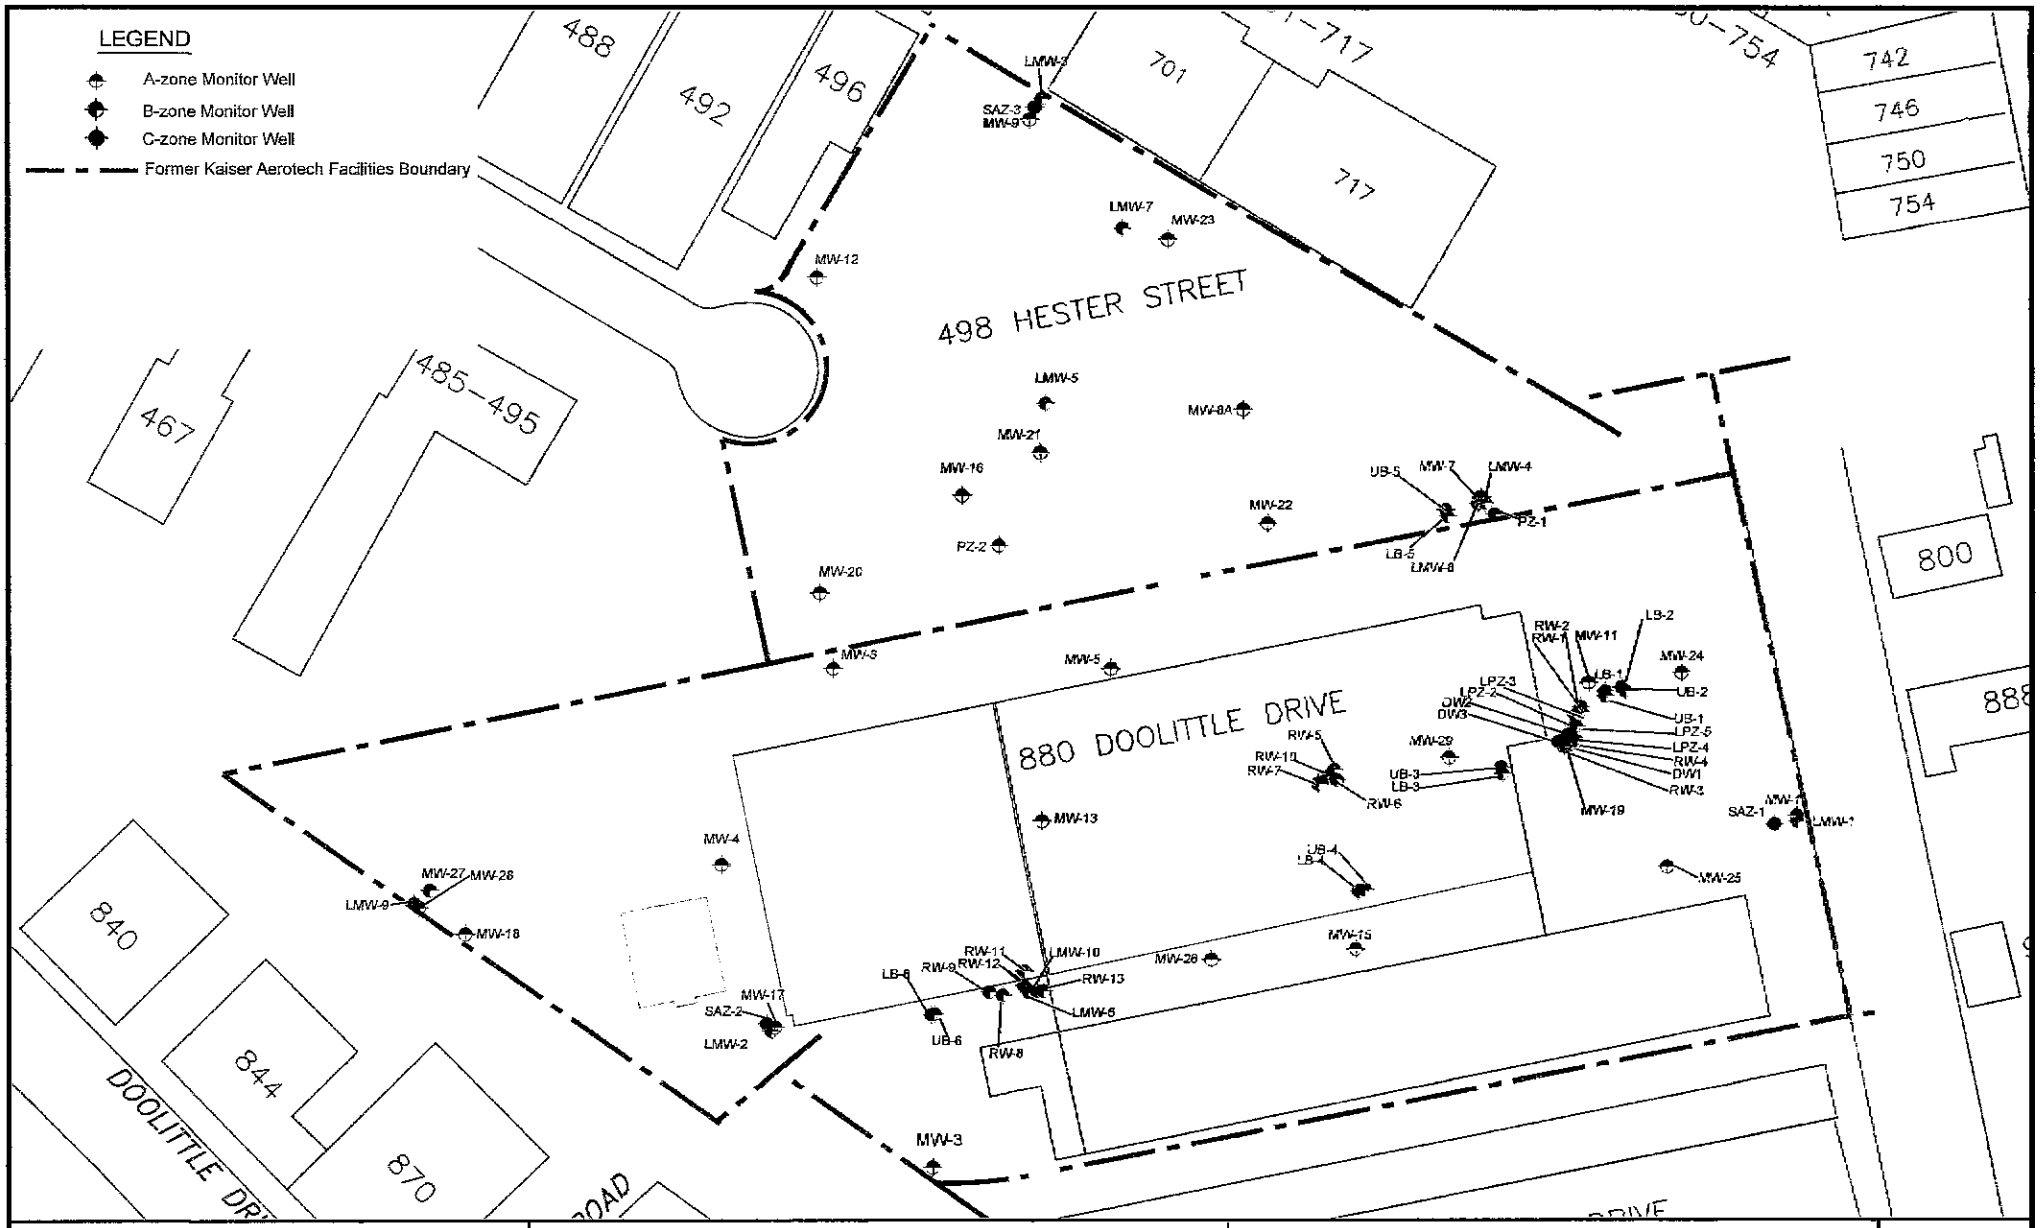
Parcel B.

BEGINNING at a point on the northeastern line of the right-of-way 60 feet wide of Southern Pacific Company which is south 55° 31' east 428.91 feet from the intersection of the north line of the parcel of land conveyed by Gertrude A. McNamara et al, to Robert L. Osborne by deed dated August 27, 1945, recorded September 12, 1945, in Book 4773 of Official Records, Alameda County, at page 365, with the northeastern line of said right-of-way 60 feet wide of the Southern Pacific Company; running thence from said point of beginning north 77° 33' east 82.13 feet; running thence in a southwesterly direction to a point on the northeastern line of the said right-of-way 60 feet wide of the Southern Pacific Company, which point bears north 44° 56' east from a point on the northeastern line of Bay Shore Boulevard or County Road No. 1434, distant thereon north 45° 04' west 1,247.30 feet from the northwestern line of Davis Street or County Road No. 1434; running thence north 55° 31' west along the northeastern line of the said right-of-way 60 feet wide of the Southern Pacific Company to the point of beginning.

TOGETHER with a non-exclusive perpetual easement (subject to abandonment by Kaiser Aerospace & Electronics Corporation, or its assigns at its or their option) appurtenant to Parcel 3 over and upon the following described property situate in the Township of Eden, County of Alameda, California, which easement is described as follows:



AN EASEMENT lying seven and one-half feet each side of the following described center-line:



COMMENCING at a point on the northeastern line of Doolittle Drive (formerly known as County Road No. 1434 or Andrews Landing Road) distant thereon north 45° 04' west 1287.30 feet from the intersection thereof with the northwestern line of Davis Street as said street now exists; thence north 44° 56' east 279.26 feet to the northeastern line of the right-of-way of the Southern Pacific Company, 60 feet wide; thence north 77° 33' east 21.97 feet to the actual point of beginning for this description; running thence parallel to said

northeastern line of the right-of-way of the Southern Pacific Company south 55° 31' east 1090.99 feet to an angle point; thence south 47° 15' 15" east 176.90 feet to the said northwestern line of the Southern Pacific right-of-way;

for the construction, installation and maintenance of a 10" sewer line for the joint use of Kaiser Aerospace & Electronics Corporation and the owners, users and occupants of the said premises over which said easement traverses; provided, however, that Kaiser Aerospace & Electronics Corporation shall at all times be entitled to the priority use of the capacity of said sewer line comparable to the capacity of an 8" sewer line; the cost and maintenance of said sewer line to be borne jointly in the same proportion by Kaiser Aerospace & Electronics Corporation, and the owners, users or occupants of the said premises over which said easement traverses.

Parcel 5: The following easement (i) the easements described in a Deed dated January 18, 1954, executed by Robert L. Osborne and Katherine A. Osborne, recorded January 27, 1954, in Book 7236 of Official Records of Alameda County, California, page 165, et seq., and (ii) in that certain easement dated August 16, 1951, executed by Robert L. Osborne and Katherine A. Osborne, recorded September 14, 1951, in Book 6535 of Official Records of Alameda County, California, page 277, which last mentioned easement was made perpetual and appurtenant to Parcel 3 by said Deed dated January 18, 1954; which easements were transferred from Wilco Properties, Inc. to Kaiser Industries Corporation by a Grant Deed dated October 31, 1957, recorded November 6, 1957, in Book 8514, page 511, et seq., of Official Records of Alameda County, California.

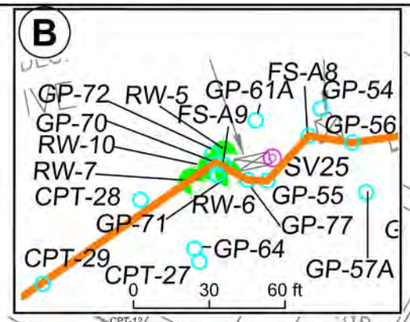
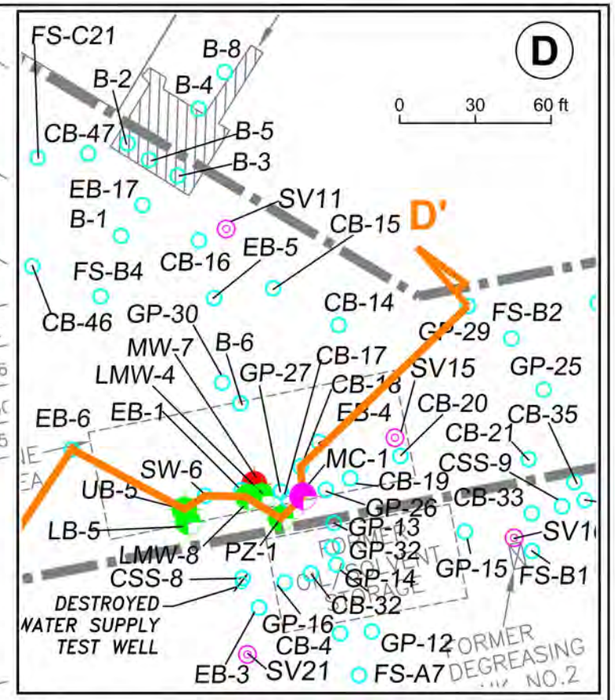
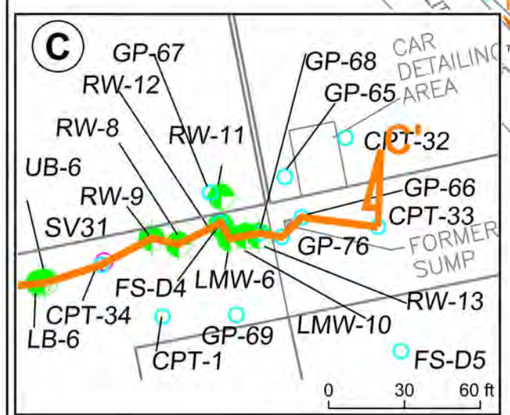
SGI environmental THE SOURCE GROUP, INC. 3451-C VINCENT ROAD PLEASANT HILL, CA 94523	Date: 2/6/08 Figure: 5 TCE B-zone.dwg



LEGEND



- A-zone well
- B-zone well
- C-zone well
- Multichambered well (A + B)
- Soil boring location
- Destroyed water supply test well
- Former Kaiser Aerotech Facilities boundary



Note:
Wells DW1, DW2, DW3 and MW-27
screen across portions of the A- and B-zones.

TCE Trichloroethene
DCE Dichloroethene
< Not detected at or above the specified reporting limit
Volatile organic compound analyses (VOC) conducted after January 2002 by EPA Method 8260B.

APPENDIX C4

HISTORICAL GROUNDWATER DATA

Notes:
1. Wells F-2 and MW-27 screen portions of the A- and B- zones.
2. PCE concentrations (ug/L) where reported.
3. Primary/Duplicate results presented.
4. Where well was not sampled during this event, most recent data is posted.

LEGEND

- RDIP Direct-Push Injection Location
- A-zone Monitoring Well
- A-zone/B-zone Monitoring Well
- Mutichambered Monitoring Well
- Destroyed Well
- 151 TCE Concentration (ug/L)
- MW-28 Sodium Lactate Injection Well
- 1,000 - 10,000 ug/L
- 10,000 - 100,000 ug/L
- >100,000 ug/L
- TCE Trichloroethene
- PCE Tetrachloroethene
- --1000-- Approximate TCE Isoconcentration Contour (ug/L)
- ug/L Microgram per Liter
- Former Kaiser Aerotech Facilities Boundary
- Approximate Sand Lens Boundary Between 5 and 10 Feet Below Ground Surface (ETIC, December 27, 2002)
- * Data Prior to March 2020

After Apex, 2017

Notes:

A	A-zone - approximately 5-15 feet below ground surface
B	B-zone
LB	Lower B-zone, generally screening 25-35 feet below ground surface
UB	Upper B-zone, generally screening 15-25 feet below ground surface
C	C-zone - below approximately 35-40 feet below ground surface

HVOC - Halogenated volatile organic compounds using USEPA Method 8260B (8010 list)

ORP - Oxidation-Reduction Potential (reported in millivolts (mV)

SC - Specific conductance (reported in microsiemens per centimeter [µS/cm])

Annual - first quarter

Biennial - first quarter, odd numbered years

Semi-Annual - third quarter

ERD - Enhanced reductive dechlorination

MNA - Monitored natural attenuation

Contingency[1] Samples will be collected at these Degreasing Tank no. 1 wells based on semi-annual (third quarter) field parameter readings. If ORP is above 0 mV, pH is below 5.0/above 9.0, and/or specific conductance is below 1,200 µS/cm, a sample will be collected for HVOC analysis.

Contingency[2] Samples will be collected at wells RW-5 and RW-8 based on annual field parameter readings. If ORP is above 0 mV, pH is below 5.0/above 9.0, and/or specific conductance is below 1,200 µS/cm, a sample will be collected for HVOC analysis.

Contingency[3] Samples will be collected and field parameters will be measured at the C-zone wells if water levels indicate a downward hydraulic gradient between the B-zone and C-zone. Samples will be analyzed for HVOCs.

Discretionary samples from treatment areas may also be analyzed for ethene, ethane and methane using Method RSK 175M and/or total organic carbon using Standard Method 5310D. These supplemental analyses will be evaluated based on field parameters, and findings for nearby monitoring wells.

Table 5H
Groundwater Monitoring Volatile Organic Compounds Data
Monitored Natural Attenuation and Destroyed/Not Used Wells
Former Kaiser Aerotech Facilities
San Leandro, California

Notes:

*Volatile organic compound analyses (VOC) conducted after October 2002 by EPA Method 8260B.
VOC analyses conducted prior to that date by EPA Methods 8260B, 8021B or previously promulgated equivalents (EPA 8010, 8240).
Maximum contaminant levels (MCLs) and regulatory dates from Drinking Water, U.S.EPA vs. California, updated March 2018.
Concentrations above noted MCLs are emboldened.

GW Zone	Groundwater Zone
A	A-zone - approximately 5-15 feet below ground surface
UB	Upper B-zone - approximately 15-25 feet below ground surface
LB	Lower B-zone - approximately 25-35 feet below ground surface
C	C-zone - below approximately 35-40 feet below ground surface
DCB	Dichlorobenzene
TCA	Trichloroethane
DCA	Dichloroethane
PCE	Tetrachloroethene
TCE	Trichloroethene
DCE	Dichloroethene
ug/L	Micrograms per liter
<	Not detected at or above the specified reporting limit
(d), DUP	Duplicate sample
grab	well not purged prior to sampling
--	Not reported
J4	The associated batch QC was outside the established quality control range for accuracy.
PT	Results may reflect influence of noted pilot test activities.
GWE	Pumping Test
ISCO Mn	Permanganate Injection Test
ISCO FR	Modified Fenton's Reagent Pilot Test
DPE	High Vacuum Dual Phase Extraction
ERD	Enhanced Reductive Dechlorination using Sodium Lactate
RDIP	Results may reflect influence of ERD activities outlined in Remedial Design and Implementation Plan.
O&M	Operation and Maintenance Plan Monitoring Program
Sup.	Supplemental sampling to evaluate concentration trends from upgradient offsite source(s)
1	Sample for MW-17 mislabeled in field; appears as LMW-2 in lab report.
2	Estimated concentration; recovery value exceeded calibration range of instrument.
3	Sample mislabeled in field; appears as SAZ-1 in lab report. Results suggest potential cross-contamination.
4	Wells MW-2, MW-8, MW-10, MW-14 and MC-1 destroyed in May 2009.
5	Well MW-8 was reported as abandoned in March 1997 (SECOR, 1997) and relocated in October 2003.
6	Wells IW-2 and TP-1 destroyed in June 2003.
7	1,2-dichloropropane at 1.5 µg/L in well RW-1 and 2.1 µg/L in well RW-4.
8	1,2-dichloropropane at 1.2 µg/L in well LPZ-5.
9	1,2-dichloropropane at 0.51 µg/L in well LPZ-2, 0.90 µg/L in well LPZ-3, 1.6 µg/L in well LPZ-5, and 1.0 µg/L in well LB-3.
10	1,2-dichloropropane at 1.4 µg/L in well LPZ-3, 3.9 µg/L in well LPZ-5, and 0.95 µg/L in well LB-3.
11	2-chlorotoluene at 2.91 µg/L in well MW-27.
12	1,2,4-trichlorobenzene at 1.42 µg/L in well PZ-2.
13	2-chlorotoluene at 9.60 µg/L in well MW-28, 1.59 µg/L in well MW-27, 6.78 µg/L in well LMW-9, and 7.75 µg/L in well FA-1.
14	1,2,4-trichlorobenzene at 1.27 µg/L in well PZ-2.
15	1,2-dichloropropane at 1.19 µg/L in well LPZ-3.
16	2-chlorotoluene at 5.14 µg/L in well MW-28, 1.81 µg/L in well MW-27, and 2.63 µg/L in well LMW-9.

Notes:

GW Zone — Groundwater Zone
A — A-zone - approximately 5-15 feet bgs
UB — Upper B-zone - approximately 15-25 feet bgs
LB — Lower B-zone - approximately 25-35 feet bgs
C — C-zone - below approximately 35-40 feet bgs
TOC — Total Organic Carbon
bgs — Below ground surface
ft BTOC — Feet below top of casing
ft msl — Elevation in feet relative to mean sea level
Inc. — Inconclusive
mg/L — milligrams per liter
mV — millivolts
µS/cm — microsiemens per centimeter
-- — Not reported
Note 1 — TOC was analyzed by EPA Method 415.1 or Standard Method (SM) 5310D prior to 2015, SM5310D in 2016, SM5310B in 2015 and 2017,

Results may reflect influence of noted pilot/field test activities:
PT — Pumping Test
GWE — Groundwater Extraction
ISCO Mn — Permanganate Injection Test
ISCO FR — Modified Fenton's Reagent Pilot Test
DPE — High Vacuum Dual Phase Extraction
ERD — Enhanced Reductive Dechlorination using Sodium Lactate
RDIP — Results may reflect influence of ERD outlined in the Remedial Design and Implementation Plan RDIP, April 28, 2008)
O&M — Operation and Maintenance Plan Monitoring Program
Sup. — Supplemental sampling to evaluate concentration trends from upgradient offsite source(s)
1 — Well IW-1 was reconstructed as B-zone well IW-2 in 2000. Well IW-2 was destroyed in June 2003.
2 — Wells MW-2, MW-8, MW-10, MW-14 and MC-1 destroyed in May 200
3 — Well MW-8 was reported as abandoned in March 1997 (SECOR, 1997); found during construction activities in October 2003.

APPENDIX C5

HISTORICAL SUBSLAB VAPOR, INDOOR AIR, AND SOIL VAPOR DATA

LEGEND

- Former Kaiser Aerotech Facilities Boundary
- A-zone Monitoring Well
- VP-1 Subslab Vapor Sample Location (April 16, 2020)
- IA-1 Indoor Air Sample Location (April 15, 2020)
- AA-1 Ambient Air Sample Location (April 15, 2020)
- B — The same analyte is found on the associated blank.
- E — The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration
- Z1 — The reported value is an estimate.

Notes:
1. All results reported in micrograms per cubic meter (µg/m³).
2. Where duplicate samples are analyzed, highest concentration reported.
3. Concentrations above commercial/industrial screening levels are shaded.
4. In order of priority, indoor air screening level represents DTSC screening level (April 2019) or USEPA Regional Screening Level (November 2019).
5. Subslab vapor screening level represents indoor air screening level divided by attenuation factor of 0.03.

Notes:
Detections are indicated in **bold**.
Highlighted value exceeds the DTSC SL / USEPA RSL for commercial/industrial land use.
Volatile organic compounds (VOCs) measured by EPA Method TO-15 in selective ion monitoring (SIM) acquisition mode.
$\mu g/m^3$ = micrograms per cubic meter.
DTSC SL = Department of Toxic Substances Control Screening Level (DTSC, June 2020).
USEPA RSL = U.S. Environmental Protection Agency Regional Screening Level (USEPA, May 2021).
ARAL = Accelerated Response Action Level.
URAL = Urgent Response Action Level.
-- = No published value or not reported.
<0.136 = Not detected above indicated laboratory reporting limit.
[1] For constituents where DTSC SLs (HHRA Note 3) are not published, USEPA RSLs are used.
[2] The TCE indoor air action levels shown represent commercial/industrial exposure scenario for a 8-hour workday (DTSC, 2014).

PCE = Tetrachloroethene.
TCE = Trichloroethene.
DCE = Dichloroethene.
DCA = Dichloroethane.
B = The same analyte is found in the associated blank.
Z1 = The reported value is an estimate.

Within = Within footprint of proposed new commercial building
Near = Near footprint of proposed new commercial building

Notes:
Detections are indicated in **bold**.
Highlighted value exceeds the DTSC SL / USEPA RSL for commercial/industrial land use for default attenuation factor ($AF_{default}$) of 0.03.
Volatile organic compounds (VOCs) measured by EPA Method TO-15.
Refer to laboratory report for full analyte list. Other VOCs were reported by the laboratory however concentrations were either low (below commercial SLs) or constituents do not have screening levels associated with them and are not expected to be regulatory drivers for environmental response (Table 3).

$\mu g/m^3$ = micrograms per cubic meter.
DTSC SL = Department of Toxic Substances Control Screening Level (DTSC, June 2020).
USEPA RSL = U.S. Environmental Protection Agency Regional Screening Level (USEPA, May 2021).
ARAL = Accelerated Response Action Level.
URAL = Urgent Response Action Level.
AF = attenuation factor.
ND<0.793 = Not detected above indicated laboratory reporting limit.
-- = No published value.
PCE = Tetrachloroethene.
TCE = Trichloroethene.
DCE = Dichloroethene.
Within = Within footprint of proposed new commercial building
Near = Near footprint of proposed new commercial building
E = The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (iCAL).
[1] In order of priority, the screening level represents the DTSC-modified screening level (DTSC, 2020) followed by USEPA Regional Screening Level (RSL; USEPA, 2021).
[2] The screening level for subslab vapor is calculated by dividing the applicable indoor air screening level by the $AF_{default}$ of 0.03 (USEPA, 2015).
[3] The screening level for subslab vapor is calculated by dividing the applicable indoor air screening level by the AF_{fcb} of 0.0005 (DTSC, 2011).
[4] The TCE action levels represent commercial/industrial exposure scenario for a 8-hour workday (DTSC, 2014).

Notes:
Detections are indicated in **bold**.
Highlighted value exceeds the DTSC SL / USEPA RSL for commercial/industrial land use for default attenuation factor ($AF_{default}$) of 0.03.
Volatile organic compounds (VOCs) measured by EPA Method TO-15.
$\mu g/m^3$ = micrograms per cubic meter.
DTSC SL = Department of Toxic Substances Control Screening Level (DTSC, June 2020).
USEPA RSL = U.S. Environmental Protection Agency Regional Screening Level (USEPA, May 2021).
ND<1.36 = Not detected above indicated laboratory reporting limit.
PCE = Tetrachloroethene.
TCE = Trichloroethene.
DCE = Dichloroethene.
DCB = Dichlorobenzene.
DCA = Dichloroethane.
Freon-11 = Trichlorofluoromethane.
Freon-12 = Dichlorodifluoromethane.
MEK = Methyl ethyl ketone (2-Butanone).
ARAL = Accelerated Response Action Level.
URAL = Urgent Response Action Level.
AF = attenuation factor.
MIBK = Methyl isobutyl ketone (4-Methyl-2-pentanone).
TMB = Trimethylbenzene.
TMP = Trimethylpentane.
[1] In order of priority, the screening level represents the DTSC-modified screening level (DTSC, 2020) followed by USEPA Regional Screening Level (RSL; USEPA, 2021).
[2] The screening level for soil vapor is calculated by dividing the applicable indoor air screening level by the $AF_{default}$ of 0.03 (USEPA, 2015).
[3] The screening level for soil vapor is calculated by dividing the applicable indoor air screening level by the AF_{fcb} of 0.0005 (DTSC, 2011).
[4] The TCE action levels represent commercial/industrial exposure scenario for a 8-hour workday (DTSC, 2014).

GENERAL INFORMATION

- This notification form shall be used to notify the BAAQMD of any projects subject to the reporting requirements in Regulation 8, Rule 40, Sections 401 through 405. Notifications may be emailed to compliance@baaqmd.gov; or mailed to the address listed at the bottom of this form.
- An invoice for payment will be sent to the person listed under "Contractor Information" as the person responsible, unless the project is exempt from fee payment (see next item).
- See "Frequently Asked Questions" (FAQ) for definition of projects, change procedures, permit requirements, emergency conditions, project exemptions, and fee exemptions. For any questions not answered in the FAQ, contact the Compliance Assistance Counselor at (415) 749-4999.

INSTRUCTIONS

- **SITE OF ACTIVITY:** Give the site street address and indicate if it has any existing BAAQMD site number, for either a plant or GDF. Identify the specific project location if the site contains more than one building. Indicate all applicable activity types by checking appropriate boxes. For reporting requirements under Sections 401 through 403, additional information is required, as below.
- **CONTRACTOR INFORMATION:** Identify the contractor that is responsible for performing the work at the site location listed. This contractor is also responsible for payment of the applicable notification fee, if the project is not exempt.
- **SECTION 401 - TANK REMOVAL/REPLACEMENT:** All soils disturbed and/or excavated as part of the tank removal shall be subject to the requirements of Sections 304 through 306, unless the soil has been determined not to be contaminated by measurement of organic content using the procedures in Sections 601 and 602. Complete requirements for Section 402 or submit sample results showing that the soil is not contaminated.
- **SECTION 402 - CONTAMINATED SOIL EXCAVATION AND REMOVAL:**
  - Be as accurate as possible for the Scheduled Start and Completion Dates. Specific requirements apply for excavation projects triggered within either 45 or 90 days (Reg. 8-40-306.4) and Authority to Construct requirements for projects lasting longer than three months (Reg. 2-1-128.16).
  - If a vapor suppressant is used, attach a product data sheet or MSDS.
  - If Method of Site Closure used is Onsite Treatment, describe specific method, (e.g., bioremediation, vapor extraction, air sparging, thermal desorption, etc.).
  - If Onsite Treatment is used, indicate whether an Authority to Construct was obtained by providing the Application No. or attach copy of BAAQMD Certification of Exemption.
- **SECTION 403 – AERATION OF SOIL < 50 PPMW ORGANIC CONTENT:** Section 301 exempts from control the aeration of soil containing less than 50 ppmw of organic compounds, but Section 403 still requires reporting of **ANY** soil aeration. If such a project does not meet the exemption criteria of Section 118, then a Permit Application and Risk Screening Analysis must be submitted.
- **EMERGENCY REMOVAL INFORMATION (IF APPLICABLE):** The rule defines an emergency tank removal or excavation of contaminated soil as "carried out pursuant to an order of a state or local government agency issued because the contaminated soil poses an imminent threat to public health and safety." If the project(s) meet this definition, then identify the agency that issued the order. Under Section 402 requirements, on line two, identify the purpose as indicated in the order.

APPENDIX E

DEPARTMENT OF TOXIC SUBSTANCES CONTROL (DTSC)

INFORMATION ADVISORY CLEAN IMPORTED FILL MATERIAL

Information Advisory
Clean Imported Fill Material

October 2001

DEPARTMENT OF TOXIC SUBSTANCES CONTROL

It is DTSC's mission to restore, protect and enhance the environment, to ensure public health, environmental quality and economic vitality, by regulating hazardous waste, conducting and overseeing cleanups, and developing and promoting pollution prevention.

State of California

California Environmental Protection Agency

Executive Summary

This fact sheet has been prepared to ensure that inappropriate fill material is not introduced onto sensitive land use properties under the oversight of the DTSC or applicable regulatory authorities. Sensitive land use properties include those that contain facilities such as hospitals, homes, day care centers, and schools. This document only focuses on human health concerns and ecological issues are not addressed. It identifies those types of land use activities that may be appropriate when determining whether a site may be used as a fill material source area. It also provides guidelines for the appropriate types of analyses that should be performed relative to the former land use, and for the number of samples that should be collected and analyzed based on the estimated volume of fill material that will need to be used. The information provided in this fact sheet is not regulatory in nature, rather is to be used as a guide, and in most situations the final decision as to the acceptability of fill material for a sensitive land use property is made on a case-by-case basis by the appropriate regulatory agency.

Introduction

The use of imported fill material has recently come under scrutiny because of the instances where contaminated soil has been brought onto an otherwise clean site. However, there are currently no established standards in the statutes or regulations that address environmental requirements for imported fill material. Therefore, the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) has prepared this fact sheet to identify procedures that can be used to minimize the possibility of introducing contaminated soil onto a site that requires imported fill material. Such sites include those that are undergoing site remediation, corrective action, and closure activities overseen by DTSC or the appropriate regulatory agency. These procedures may also apply to construction projects that will result in sensitive land uses. The intent of this fact sheet is to protect people who live on or otherwise use a sensitive land use property. By using this fact sheet as a guide, the reader will minimize the chance of introducing fill material that may result in potential risk to human health or the environment at some future time.

Overview

Both natural and manmade fill materials are used for a variety of purposes. Fill material properties are commonly controlled to meet the necessary site specific engineering specifications. Because most sites requiring fill material are located in or near urban areas, the fill materials are often obtained from construction projects that generate an excess of soil, and from demolition debris (asphalt, broken concrete, etc.). However, materials from those types of sites may or may not be appropriate, depending on the proposed use of the fill, and the quality of the assessment and/or mitigation measures, if necessary. Therefore, unless material from construction projects can be demonstrated to be free of contamination and/or appropriate for the proposed use, the use of that material as fill should be avoided.

Selecting Fill Material

In general, the fill source area should be located in nonindustrial areas, and not from sites undergoing an environmental cleanup. Nonindustrial sites include those that were previously undeveloped, or used solely for residential or agricultural purposes. If the source is from an agricultural area, care should be taken to insure that the fill does not include former agricultural waste process byproducts such as manure or other decomposed organic material. Undesirable sources of fill material include industrial and/or commercial sites where hazardous ma-

Potential Contaminants Based on the Fill Source Area

Fill Source:	Target Compounds
Land near to an existing freeway	Lead (EPA methods 6010B or 7471A), PAHs (EPA method 8310)
Land near a mining area or rock quarry	Heavy Metals (EPA methods 6010B and 7471A), asbestos (polarized light microscopy), pH
Agricultural land	Pesticides (Organochlorine Pesticides: EPA method 8081A or 8080A; Organophosphorus Pesticides: EPA method 8141A; Chlorinated Herbicides: EPA method 8151A), heavy metals (EPA methods 6010B and 7471A)
Residential/acceptable commercial land	VOCs (EPA method 8021 or 8260B, as appropriate and combined with collection by EPA Method 5035), semi-VOCs (EPA method 8270C), TPH (modified EPA method 8015), PCBs (EPA method 8082 or 8080A), heavy metals including lead (EPA methods 6010B and 7471A), asbestos (OSHA Method ID-191)

**The recommended analyses should be performed in accordance with USEPA SW-846 methods (1996). Other possible analyses include Hexavalent Chromium: EPA method 7199*

Recommended Fill Material Sampling Schedule

Area of Individual Borrow Area	Sampling Requirements
2 acres or less	Minimum of 4 samples
2 to 4 acres	Minimum of 1 sample every 1/2 acre
4 to 10 acres	Minimum of 8 samples
Greater than 10 acres	Minimum of 8 locations with 4 subsamples per location
Volume of Borrow Area Stockpile	**Samples per Volume**
Up to 1,000 cubic yards	1 sample per 250 cubic yards
1,000 to 5,000 cubic yards	4 samples for first 1000 cubic yards +1 sample per each additional 500 cubic yards
Greater than 5,000 cubic yards	12 samples for first 5,000 cubic yards + 1 sample per each additional 1,000 cubic yards

terials were used, handled or stored as part of the business operations, or unpaved parking areas where petroleum hydrocarbons could have been spilled or leaked into the soil. Undesirable commercial sites include former gasoline service stations, retail strip malls that contained dry cleaners or photographic processing facilities, paint stores, auto repair and/or painting facilities. Undesirable industrial facilities include metal processing shops, manufacturing facilities, aerospace facilities, oil refineries, waste treatment plants, etc. Alternatives to using fill from construction sites include the use of fill material obtained from a commercial supplier of fill material or from soil pits in rural or suburban areas. However, care should be taken to ensure that those materials are also uncontaminated.

Documentation and Analysis

In order to minimize the potential of introducing contaminated fill material onto a site, it is necessary to verify through documentation that the fill source is appropriate and/or to have the fill material analyzed for potential contaminants based on the location and history of the source area. Fill documentation should include detailed information on the previous use of the land from where the fill is taken, whether an environmental site assessment was performed and its findings, and the results of any testing performed. It is recommended that any such documentation should be signed by an appropriately licensed (CA-registered) individual. If such documentation is not available or is inadequate, samples of the fill material should be chemically analyzed. Analysis of the fill material should be based on the source of the fill and knowledge of the prior land use.

Detectable amounts of compounds of concern within the fill material should be evaluated for risk in accordance with the DTSC Preliminary Endangerment Assessment (PEA) Guidance Manual. If

metal analyses are performed, only those metals (CAM 17 / Title 22) to which risk levels have been assigned need to be evaluated. At present, the DTSC is working to establish California Screening Levels (CSL) to determine whether some compounds of concern pose a risk. Until such time as these CSL values are established, DTSC recommends that the DTSC PEA Guidance Manual or an equivalent process be referenced. This guidance may include the Regional Water Quality Control Board's (RWQCB) guidelines for reuse of non-hazardous petroleum hydrocarbon contaminated soil as applied to Total Petroleum Hydrocarbons (TPH) only. The RWQCB guidelines should not be used for volatile organic compounds (VOCs) or semi-volatile organic compounds (SVOCS). In addition, a standard laboratory data package, including a summary of the QA/QC (Quality Assurance/Quality Control) sample results should also accompany all analytical reports.

When possible, representative samples should be collected at the borrow area while the potential fill material is still in place, and analyzed prior to removal from the borrow area. In addition to performing the appropriate analyses of the fill material, an appropriate number of samples should also be determined based on the approximate volume or area of soil to be used as fill material. The table above can be used as a guide to determine the number of samples needed to adequately characterize the fill material when sampled at the borrow site.

Alternative Sampling

A Phase I or PEA may be conducted prior to sampling to determine whether the borrow area may have been impacted by previous activities on the property. After the property has been evaluated, any sampling that may be required can be determined during a meeting with DTSC or appropriate regulatory agency. However, if it is not possible to analyze the fill material at the borrow area or determine that it is appropriate for use via a Phase I or PEA, it is recommended that one (1) sample per truckload be collected and analyzed for all compounds of concern to ensure that the imported soil is uncontaminated and acceptable. (See chart on Potential Contaminants Based on the Fill Source Area for appropriate analyses). This sampling frequency may be modified upon consultation with the DTSC or appropriate regulatory agency if all of the fill material is derived from a common borrow area. However, fill material that is not characterized at the borrow area will need to be stockpiled either on or off-site until the analyses have been completed. In addition, should contaminants exceeding acceptance criteria be identified in the stockpiled fill material, that material will be deemed unacceptable and new fill material will need to be obtained, sampled and analyzed. Therefore, the DTSC recommends that all sampling and analyses should be completed prior to delivery to the site to ensure the soil is free of contamination, and to eliminate unnecessary transportation charges for unacceptable fill material.

Composite sampling for fill material characterization may or may not be appropriate, depending on quality and homogeneity of source/borrow area, and compounds of concern. Compositing samples for volatile and semivolatile constituents is not acceptable. Composite sampling for heavy metals, pesticides, herbicides or PAH's from unanalyzed stockpiled soil is also unacceptable, unless it is stockpiled at the borrow area and originates from the same source area. In addition, if samples are composited, they should be from the same soil layer, and not from different soil layers.

When very large volumes of fill material are anticipated, or when larger areas are being considered as borrow areas, the DTSC recommends that a Phase I or PEA be conducted on the area to ensure that the borrow area has not been impacted by previous activities on the property. After the property has been evaluated, any sampling that may be required can be determined during a meeting with the DTSC.

REVISED SOIL AND GROUNDWATER MANAGEMENT PLAN (SGMP) APPROVAL LETTER FOR THE FORMER KAISER AEROTECH FACILITIES (200559-11018)

Dear Mr. Richer:

The Department of Toxic Substances Control (DTSC) has reviewed the Revised Soil and Groundwater Management Plan (SGMP) for the Former Kaiser Aerotech Facilities site (Site) located at 880 Doolittle Drive and 498 Hester Street, San Leandro, California, submitted by RMD Environmental Solutions, Inc. (RMD) and dated June 11, 2021. The purpose of this SGMP is to provide guidance for proper handling, management, and disposal of impacted soil and groundwater that may be encountered during the activities described in the plan. This SGMP has been revised to incorporate responses to May 7, 2021 DTSC comments.

DTSC hereby approves the SGMP. Please submit one final paper copy for the Site file with attention to project manager Yongsheng “Johnny” Sun.

If you have any questions or need further assistance, please contact project manager Yongsheng “Johnny” Sun at yongsheng.sun@dtsc.ca.gov, or (510) 540-3872.

Sincerely,

John Karachewski

ADDITIONAL IMPACT EVALUATIONS 14

CONCLUSION 17

INTRODUCTION

Ostergaard Acoustical Associates (OAA) was asked to assist with the evaluation of potential sound emissions from a proposed speculative distribution facility planned for construction in San Leandro, Alameda County, California. The project site is located southeast of the Hester Street cul-de-sac and currently comprises an industrial warehouse. Plans call for all existing structures on site to be removed and the construction of a distribution facility in the southeastern portion of the site. This report addresses on-site noise radiated to nearby potentially noise-sensitive receptors.

The purpose of this sound study is to analyze future site sound emissions for comparison with applicable code limits and to evaluate the potential for noise complaints. Research indicates that the City of San Leandro does have a noise code, but it generally discusses noise in a qualitative manner and provides no applicable quantitative limits. The County noise code has merit and while not enforceable within City limits, was used as a foundation for development of project noise goals. Therefore, expected site sound emissions from the facility were evaluated against criteria recommended by OAA based the County noise code limits, professional experience, and information available on existing ambient conditions. The objective of the project goal is to protect potentially noise sensitive receptors and meet the intent of the City noise code. Sound produced by the site comprises steady sound from rooftop HVAC equipment as well as intermittent sound from truck and car[1] movements.

Work by OAA was overseen by Benjamin C. Mueller, P.E., with assistance from OAA Staff. The representative at Prologis Inc. coordinating this project is Ms. Claudia Tarpin.

[1] Note that throughout this report, the term "car" collectively refers to personal passenger vehicles including automobiles, vans, pick-ups, or SUVs. The term "truck" refers to heavy trucks such as over-the-road or line-haul trucks.

SITE AND VICINITY

Figure 1 is an aerial image obtained from Google Earth outlining the site property line in red. The site and most of the surrounding area currently comprise industrial properties in the IG, Industrial General, district. Many uses in the vicinity also utilize heavy trucks. Certain properties in the area are in the IP, Industrial Park, district and accommodate non-noise-sensitive industrial uses. West of the site, across Doolittle Drive, is a golf course located in Oakland. About ¾ of a mile beyond is the Oakland International Airport; the site is in line with two of the runways. Abutting the site to the east are other industrial uses. A railroad right-of-way is 500 feet to the east with residences fronting on Tudor Court in the RS, Residential Single-Family, district beyond. Adjacent to these residences to the south are other IP and IG district uses; just east of this residential neighborhood is Interstate-880. Given the surroundings, the area is expected to be regularly exposed to moderately high sound levels, and therefore, nearby residences are not assumed to be particularly noise-sensitive. Nevertheless, site noise should still be evaluated at these receptors to assess any acoustical impact.

Plans call for the existing industrial use and all structures to be removed and a new 239,573 ft^2 distribution facility constructed roughly in the same location as the previous building. Office space will accommodate about 10,000 ft^2 of the building footprint. The remaining 229,573 ft^2 will be used for warehouse storage. The proposed building will be 50 feet tall. Existing site access will remain via Hester Street to the northwest and an unnamed street connecting to Doolittle Drive to the southwest. These driveways will accommodate both cars and trucks. Onsite driveways circle the building, allowing truck access to the truck court located along the north and south sides of the building. There are approximately 27 dock doors along the north side of the building and 37 dock doors along the south side. Associate parking is provided in a triangular lot on the west side of the building; trailer parking is provided north of the building.

Specific traffic counts depend on the end user tenant. While the extent of onsite traffic and the hours of operation are unknown, the sound study has followed the same conservative assumptions made in the traffic study, based on the size of the site and proposed building. Typical warehouses operate 24/7 with much of the activity during the daytime hours; nighttime operations are generally used to prepare for the next day. The focus of this study is to analyze potential nighttime activity as this is generally when residential receptors are most sensitive and code limits are more stringent.

Figure 1 — Google Earth image showing the proposed distribution facility site and vicinity in San Leandro, CA. The site property line is approximately outlined in red.

REGULATIONS/GOALS

When developing a site of this type, it is appropriate to consider how sound from the project will likely be received, especially by noise-sensitive receptors. Sound produced by distribution facilities is characterized by motor vehicle activity, such as idling and vehicle movement, as well as steady HVAC equipment. These sound sources were evaluated and compared to applicable noise code limits. As a general practice, when motor vehicles are on site, they are considered part of a site's sound emissions; when vehicles are on public roads, they are not. When vehicles are departing or approaching the facility, they are expected to blend in with existing traffic flow sound in the area.

City, County, and State codes were reviewed for applicable noise regulations. The City of San Leandro discusses noise in Chapter 4.1: *Noise*. The code prohibits disturbing, excessive, and offensive noise and specifically prohibits certain acts in connection with loud noise, but none are relevant to the site. All discussions of noise are in a qualitative manner and do not include quantitative limits. Zoning code Section 4-1670: *Performance Standards* also call for compliance with Chapter 4-1. Sections 2-740 and 2-741 provide additional performance standards that apply to industrial activities within 200 feet of a residential district. Because this site is 500 feet away from a residential district, these are not applicable. Alameda County also has a noise code, found under Chapter 6.60: *Noise*. While it does not apply to incorporated areas of the County, it was reviewed for thoroughness. The County noise code limits apply at receiving properties based on their use, and sets various limits based on the duration of the noise. Higher limits are allowed for shorter periods of time. In summary, steady sound is limited at residential receptors to 50 dB(A) during the day hours (0700-to-2200 hours) and 45 dB(A) during the corresponding night hours. During the night, levels up to 60 dB(A) are allowed for up to 1 minute, 55 dB(A) for up to 5 minutes, and 50 dB(A) for up to 15 minutes in a given hour. Daytime noise code limits for residences are 5 dB higher in level. Commercial noise code limits are 15 dB higher in level than residential limits. The County does not provide any limits for industrial receptors. There is also a provision that says if the ambient sound is greater than the provided limits, then the code limits shall be equal to the ambient sound level. It is not clear whether this code applies to on-site motor vehicles or not. The State of California does not have any site noise regulations but does regulates motor vehicle noise in California Vehicle Code Sections 27150 and 27200. These codes require all motor vehicle to have exhaust mufflers and provide maximum allowable sound levels for various types of vehicles at a distance of 50 feet. In particular, for heavy trucks manufactured after 1987, the maximum sound pressure level permitted is 80 dB(A) at 50 feet. This limit is readily met by vehicles in good working condition.

A brief discussion of the relevant noise codes is needed. The City code does not provide any quantitative limits for site sound emissions, and State codes for motor vehicles are relative to the vehicle, not the receptor. The County noise code has merit; while not enforceable within the City jurisdiction, it was used as a basis for development of project noise goals. OAA finds that a limit of 45 dB(A) for a residential receptor during the night is generally acceptable for steady noise sources. However, given the density and make-up of the area, it is likely overly stringent if applied here. Based on experience, an urban area such as this would naturally have ambient sound levels far greater than this limit. In our opinion, the County code allowance for excursions that occur between 1 minute and 15 minutes of 55-to-60 dB(A) are nominally acceptable at residential receptors during the night, especially for dwellings nearby well-travelled roadways.

Based on experience, OAA would typically set a project goal for steady HVAC sound of 50 dB(A) at residences during the night. Intermittent maximum sound levels from truck activity should strive to not exceed 55 dB(A). This approach is supported by the County noise code as well as the expected ambient sound levels currently present. While OAA has not carried out our own ambient sound survey, this project noise goal is acceptable and appropriate based on professional experience and several online references that provide ambient sound information for the area. Site maximum sound levels of this magnitude will be far lower in level than sound produced by the active railway adjacent to the nearby residences.

Various references support this logic. The National Transportation Noise Map of the City of San Leandro shows that the area around the site is expected to experience 24-hour average sound levels of 50-to-60 dB(A), based on data collected in 2018. This is shown graphically in Figure 2 below. In addition, a review of the City of San Leandro 2035 General Plan discusses existing and future ambient noise in Chapter 7: Environmental Hazards Element. Figure 7-6 of this report shows that residences east of the site are within the 60 dB(A) CNEL contour given their distance from Interstate-880. The report qualifies this contour as being normally or conditionally acceptable in Chart 7-2. Note that the General Plan uses the CNEL (Community Noise Equivalent Level) metric, which is calculated from 24-hour data; this metric is commonly used to assist in planning and zoning and is not a metric that is appropriate to evaluate the potential for acoustical impacts or complaints. OAA introduced this reference merely to support the conclusion that this area is inherently active and justify the project noise goal. Using a 24-hour metric for a distribution facility would potentially diminish the presence of the short-term maximum sound levels associated with truck activity and is not recommended.

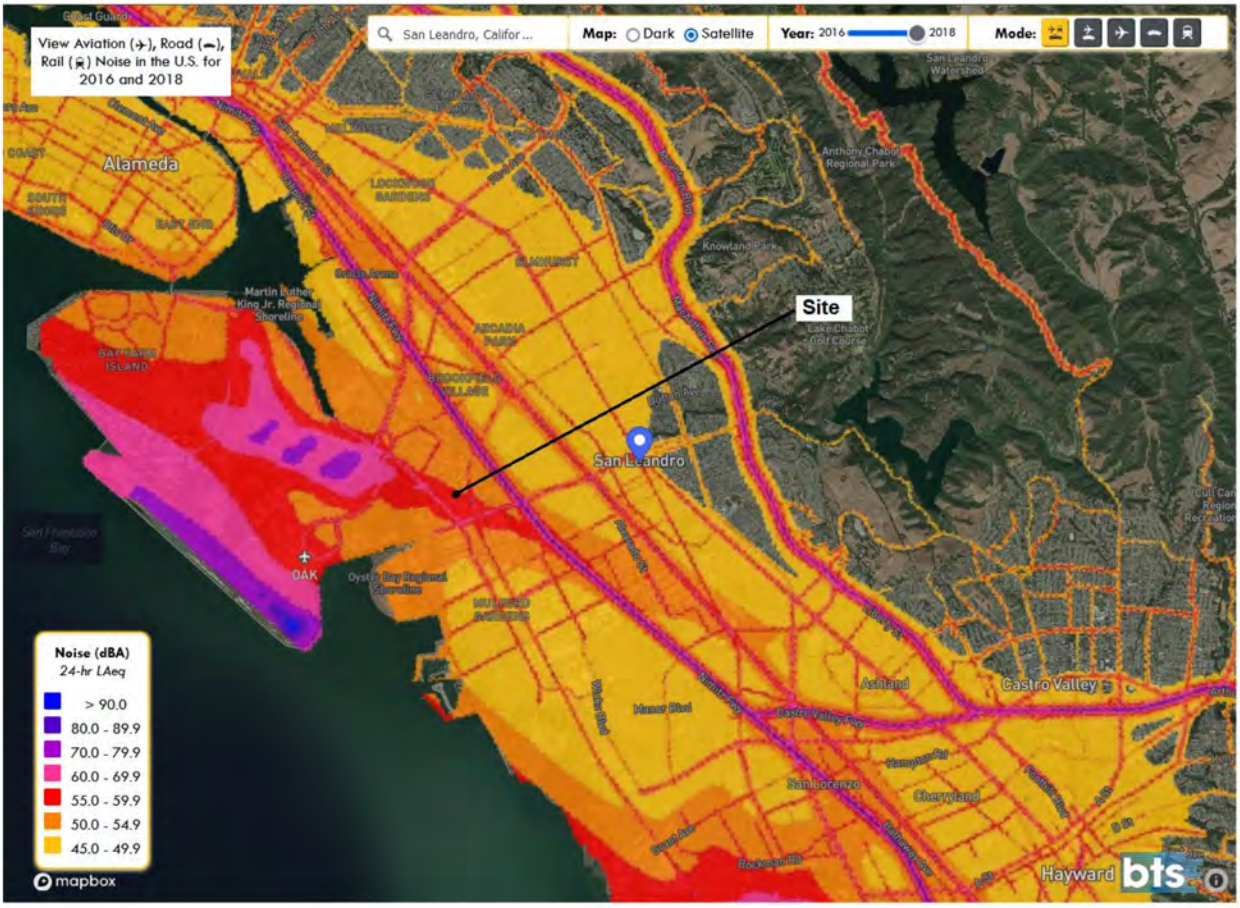

Figure 2 — Image taken from the National Transportation Noise map of San Leandro. Site location is identified on the map.

We understand that, while our recommendations are based on experience and cited references, they are considered speculative. To minimize this speculation, OAA has defaulted to using the County code nighttime limit of 45 dB(A) for steady site sound and 55 dB(A) for maximum intermittent truck sounds for residential receptors. The intermittent limit is appropriate since maximum truck operations will not occur for durations over 5 minutes in a given hour. Rational supporting this is provided in subsequent sections. Project noise goals are not warranted for industrial uses at any time, as they are not considered particularly noise-sensitive receptors.

It should be noted that a specific analysis was not carried out for personal motor vehicles. Based on experience, while they may be greater in quantity, they are significantly lower in level than heavy trucks. Hence, if on-site truck analyses are shown to meet project goals, personal motor vehicle sound will as well.

EXPECTED SOUND EMISSIONS

Acoustical modelling software, specifically CadnaA, was used to create and analyze site sound emissions for the site. The model takes into account relevant parameters between the noise source and receptor positions of interest to predict how sound will propagate. In addition to distance attenuation, the model accounts for the effects of terrain, various types of ground cover, shielding by structures, and reflections from buildings. Model results show only the sound emissions of the site, which are directly comparable to project noise goals; ambient sound is not included in the model. In the model, buildings are white, and the site property line is outlined in red. North is pointing generally up in all acoustical modelling figures.

The acoustical model shows the results graphically as A-weighted sound level contours, in 1 dB increments, and tabulates the summed A-weighted sound levels at five discrete locations at the façade of nearby residential receptors. Sound level contours are at ear height, 5 feet above grade. Location B is at 15 feet above grade to typify an upper story receptor; Locations C through F typify single story receptors at 5 feet above grade. Location A is not used and reserved for future use.

Rooftop HVAC Sound

Rooftop HVAC equipment produces noise that is nominally steady in nature, and hence will not vary significantly over time. Based on similar projects, a conservative estimation is to assume 1 ton of cooling capacity for every 725 ft^2 of building area. This equates to about fourteen (14) 25-ton HVAC units evenly distributed on top of the building. The sound power level for each 25-ton unit is assumed to be 93 dB(A) re 1 picowatt based on typical manufacturer's sound data.

The noise from the 14 rooftop units was included in the HVAC sound model. Noise sources were placed 4 feet above the rooftop, and sound was projected off site. Figure 3 shows the results graphically and tabulates the summed A-weighted sound levels at the five residential receptor Locations. The results show that, with all rooftop units operating, HVAC sound levels at off-site receptors are in the 38-to-40 dB(A) range.

This analysis shows that there is little concern about HVAC sound. HVAC sound is sufficiently controlled via distance and roof shielding effects so that this noise meets the 45 dB(A) project noise goal at all residences by wide margins. Note that for these model results to be realized, acoustical performance of HVAC equipment must be acoustically aligned with what was modelled.

Figure 3 — A-weighted sound emission contours, 5 feet above grade, from rooftop HVAC equipment. Each of the rooftop units shown with a blue + sign. Buildings shown in white. Site property line outlined in red. Location B is at 15 feet above grade; all other Locations are at 5 feet above grade.

Truck Activity

OAA has had the opportunity to visit various distribution and logistics facilities over the years to survey and document the sounds of truck activity. Distribution facilities will have over-the-road line-haul trucks as well as terminal tractors (yard tractors) active on site. Line-haul trucks deliver trailers from off-site whereas terminal tractors do not leave the site and move trailers between the docks and parking areas. Terminal tractors are responsible for the majority of back-up movements on-site. From an acoustical aspect, terminal tractors and line-haul trucks are acoustically equivalent.

Truck noise in typical dock and trailer parking areas can routinely produce maximum sound levels of 79 dB(A) at 50 feet. This sound level was determined based on OAA field data, by looking at a wide variety of truck activity, such as truck movement, air brakes, back-up alarms, and coupling/decoupling, and distilling it to a single conservative maximum level and spectrum for use in acoustical studies such as this. A driving truck exhibits slightly lower maximum sound levels of 74 dB(A) at 50 feet. Personnel vehicles produce typical maximum sound levels of 59 dB(A) at 50 feet, and hence are traditionally not an acoustical concern. The height of a truck source for all truck activity is modelled at a conservative height of 8 feet above grade. OAA has found that using these maximum sound levels at this height ensures a conservative approach to evaluating truck sound. When specific individual activities are modelled at their actual height and sound level, results are typically lower in level than predicted below. For example, many of the high sound level activities, such as back-up alarms and air brakes, occur at a height of 4 feet above grade, not 8 feet. This is a critical detail when evaluating the effectiveness of a sound barrier or berm and when considering intervening topography. It is also important to recognize that all truck noise is dynamic in nature. Maximum sound levels only occur for a short duration and are not representative of the constant sound level produced by on-site trucks.

While there will certainly be multiple trucks on-site at any given time, experience shows that off-site maximum sound levels are governed by specific individual truck activity that occurs closest to a given receptor. Several factors support this. Due to maximum levels being dynamic and short in duration, it is unlikely that multiple truck sound level maximums will occur at the exact same time and location. In addition, safe practices prevent more than one truck from operating at the same time and in the same vicinity. Hence, two short duration maximum sound levels overlapping in a manner that exacerbates the situation is very improbable. Should this extremely rare alignment occur, with two similar sources occurring at the same time and vicinity, emissions would only be 3 dB higher due to the logarithmic nature of sound pressure level addition.

Trucks were modelled at various on-site locations. Of particular interest are the worst-case truck locations; these occur at the eastern portions of the site. Truck yard activity was modelled in areas of the truck yard closest to residential receptors and modelled as a white "+". A driving truck was also modelled along the onsite driveway east of the building and is shown as a pink "+". Figures 4 through 6 take the HVAC sound model and add the intermittent maximum sound emissions contributed by on-site heavy truck activity. These figures show the following results:

- Figure 4 shows truck yard activity in the northeast portion of the site. Worst-case maximum sound emissions are 55 dB(A) at Location D and 56 dB(A) at Location E.

- Figure 5 provides the results for driving truck activity along the eastern onsite driveway. Maximum sound emissions range from 51-to-55 dB(A) at all Locations.

- Figure 6 shows sound emissions from truck yard activity in the south of the building. Worst-case emissions are 54 dB(A) at Locations B and C.

Overall, model results show that worst-case truck activity will be no greater than 56 dB(A) at off-site residential receptors. Note that Figures show the worst-case truck positions; most activity onsite will occur farther west than presented in this report and will benefit from shielding provided by intervening buildings and additional distance. As such, most activity onsite will be substantially lower than the results presented in this report. In addition to sufficiently low magnitude sound levels, a review of the traffic study, prepared by Kimley Horn and dated January 2024, shows that the proposed project expects approximately 46 truck trips, or 23 individual trucks, daily for this use. That distills down to about 1 truck each hour if spread out equally across the day; in reality, uses such as this will typically have more daytime activity than night. These low trip counts mean that should maximum sound levels occur from truck activity, that they would be infrequent and short in duration. This also supports that maximum sound levels would occur for durations of less than 1 minute in an hour; hence, modelled results would fully comply with the County noise code. OAA finds that even if the worse-case scenario of 56 dB(A) were to occur for a period of 5 minutes, that this would meet the intent of the County code goals and not result in any negative acoustical impact for this project.

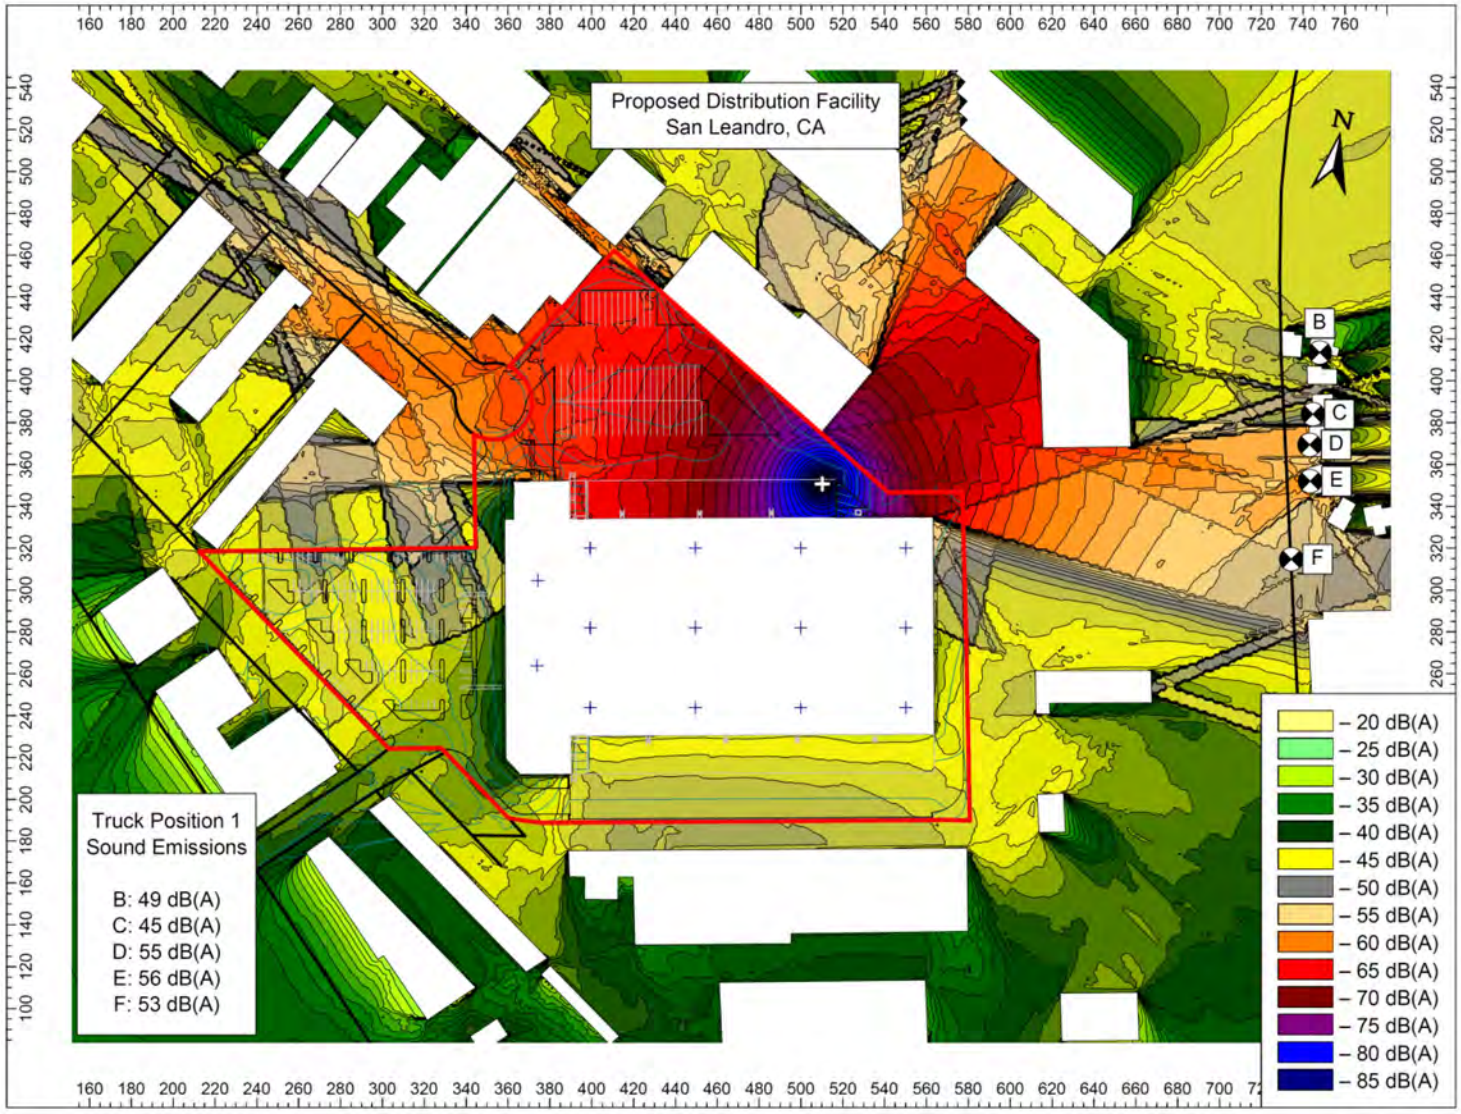

Figure 4 — A-weighted sound level contours 5 feet above grade expected for rooftop equipment and Truck Position 1. Rooftop units shown with a blue "+" sign. Heavy truck yard activity shown with a white "+" sign. Buildings shown in white. Site property line outlined in red. ADDITIONAL IMPACT EVALAUTIONS

While the focus of this study is on site sound emissions from the proposed use and the possible acoustical impact, we understand that environmental reviews traditionally also examine other types of impacts. Specifically, off-site traffic, construction noise, vibration, and airport noise have been analyzed.

Off-site Traffic

While off-site truck routes are not regulated by noise codes, they were reviewed to evaluate their potential for acoustical impact. Actual truck routes are not known but it is logical to assume that all trucks will access the site from Nimitz Freeway (Interstate-880) to the northeast via Davis Street and Doolittle Drive. These are major roads in the area and assumed to be well-travelled at all hours. While this route is in proximity to a few residences, these residences are assumed to not be particularly noise-sensitive as they are adjacent to the Interstate and it's associated on/off ramps. Given all the above, offsite routes are not expected to have any negative impact on the area and trucks going to and from the site will blend in with other traffic flow sound in the area.

Construction Noise

Construction noise that will occur during the development of the site is regulated by City noise codes. San Leandro Code §4-1-1115(b) states that construction activity which is adjacent to or across a street or right-of-way from a residential use is prohibited except between 0700-to-1900 hours during the week and between 0800-to-1900 hours on a weekend. No construction is permitted on Federal holidays. The premise of this ordinance is to contain construction activities during the daytime hours when ambient sound is higher in level and residential sensitivity is reduced.

Although construction activity is exempt from noise limits during allowable hours and are temporary in nature, it is worth discussing considerations to minimize the acoustical impact of this activity. The proposed building is almost 590 feet from the nearest dwelling. Earth moving equipment used during the civil construction phase of the project could be slightly closer to off-site receptors temporarily. Construction equipment, such as bulldozers, front end loaders, and dump trucks, can typically produce maximum sound levels of 80 dB(A) at 50 feet. At assumed distances of at least 450 feet from nearby receptors, maximum construction activity sound levels would be in the low-60s. Levels of this magnitude are not uncommon in an active developed area and are not expected to illicit noise complaints or impact the health, safety, and welfare of the

public. Regardless, to minimize receptor exposure to construction noise during this phase, the following best practice construction mitigation measures will be considered:

- ❑ Limit all heavy equipment operation to non-noise-sensitive daytime hours and follow allowable town construction hours as applicable.

- ❑ If possible, limit the number of equipment operating near one receptor at a given time. Avoid exposing any one receptor to high sound levels for an extended period of time.

- ❑ Place stationary equipment such as generators, compressors, and office trailers away from receptors.

- ❑ Avoid having construction parking or laydown areas nearby receptors.

- ❑ Coordinate any high sound level construction activities with town representatives and provide advance notice to residences as feasible.

Specific noise issues can be individually evaluated for tailored noise mitigation recommendations should traditional methods above not be sufficient.

Vibration

No City code vibration regulations were found. There is a provision in the County noise code, §6.60.050(B.8), that requires that no individual shall operate or permit the operation of any device that creates vibration which is above the vibration perception threshold at or beyond the property boundary of the source. While the County code does not apply within the City limits, this is a typical approach to evaluating vibration impacts and hence was used as criterion for this project. Off-site vibrations are challenging to quantify; as a result, it is best to discuss vibration comparatively and subjectively to determine if there may be negative impacts. The following were facts were considered:

- ❑ There are no major vibration producing equipment or activities proposed on site. The primary noise source on site is truck activity. Trucks have rubber tires which significantly reduce any vibration transmitted into the ground and off-site receptors.

- This site has historically been an industrial use for decades. The proposed use is not dramatically different than other uses in the area, which also accommodate heavy trucks. Many of these existing industrial uses are closer to residences than this project.

- The dominant source of vibration will continue to be rail activity, which is between nearby residences and this project.

Given the above, we conclude there will be no negative impact from vibrations associated with this project.

Airport Noise

Environmental impact studies generally focus on whether the proposed project might have impacts on the surrounding area. When evaluating airport noise, the focus is on whether the airport might have a negative impact on the project.

The project site is in line with, and approximately 4,500 feet east of, Runways 10L/28R and 10R/28L at Oakland International Airport. The site is about 9,000 feet northeast of Oakland International Airport's longest runway, Runway 12/30.

The Oakland International Airport implements a noise management program which monitors airport noise and mitigates complaints. Extensive information about the program as well as documents and study results can be found online at https://flyquietoak.com/. A review of the resources listed here indicates that runways in line with the site are infrequently used, between 4-12% of the time. In addition, a long-term sound monitor terminal (Monitor #10) is located on Tudor Court, which coincides with the residences closest to this project. Aircraft Noise Summary portal data show that the majority of maximum aircraft activity here is around 64 dB(A), which is driven by airport arrivals. Data also show that aircraft passovers can produce levels in excess of 80 dB(A). Despite this, the Noise Complaint Dashboard portal data show there have been 27 noise complaints from 7 individuals in San Leandro during the 2023 year. None of these complaints are in the vicinity of the site. Based on these details, OAA concludes that airport operations will not have any negative impact on this industrial use.

CONCLUSION

Plans call for the development of a distribution facility in the San Leandro, Alameda County, California. Noise sources on-site will comprise personal vehicles, heavy trucks, and rooftop HVAC units. Our review concludes that the City and State codes provide some direction but are of limited use. The County noise code has merit, despite not being enforceable within city limits. Because of this, a project noise goal at potentially sensitive receptors was established based on the County noise code, expected ambient sound levels, and professional experience. Compliance with project goals will meet the intent of the City noise code. Given the surrounding area, steady HVAC site sound emissions should strive to not exceed 45 dB(A) during the nighttime hours at nearby receptors to minimize the potential for complaints. Similarly, intermittent on-site truck activity sound levels should strive to not exceed 55 dB(A). A project noise goal is not warranted for nearby commercial and industrial properties as these properties are not considered noise-sensitive.

Analyses show that HVAC sound emissions meet the 45 dB(A) project goal via distance attenuation and roof shielding effects by wide margins. HVAC sound is expected to be below existing average ambient sound levels, and hence, will not able to be detected at nearby residential receptors. Maximum sound levels produced by on-site heavy truck activity meets the intent of project goals at all nearby existing receptors. Off-site truck routes are also of little acoustical concern to the area as trucks leaving the site will blend in with the existing traffic flow sound in the area and not be discernable from existing activity in the area. Given the above, it is our professional opinion that this project will not have any negative acoustical impact on the surrounding area. Existing sound sources in the area, such as the active railroad corridor and local and distant traffic flow will continue to dominate sound in the area. The project layout represents good acoustical planning and will put the site in a position to minimize the potential for noise complaints.

Subject: Noise Letter Report for the 880 Doolittle Drive Warehouse Project

Dear Justin:

Rincon Consultants, Inc. (Rincon) is pleased to provide this Noise Letter Report prepared for the 880 Doolittle Drive Warehouse Project (project) to ensure that it is designed by the applicant and conditioned by the City of San Leandro (City) to comply with the City's exterior and interior noise standards. The project would involve consolidating the two parcels comprising the project site into a single parcel, demolishing existing vacant structures, and developing a new industrial shell building on site. The proposed project also includes a new surface parking lot, internal circulation roadways, new utility connections, and landscaping. Nearby noise-sensitive receptors (single-family residences) would temporarily be exposed to project construction noise. This acoustical analysis reviews detailed architectural plans provided by HPA Architecture, dated September 20, 2022. Fundamentals of noise and acoustics are included in the EIR.

Regulatory Setting

City of San Leandro Noise and Land Use Compatibility

The City of San Leandro adopted the 2035 General Plan in 2016 (City of San Leandro 2016a). The City of San Leandro General Plan establishes the following goals and policies that would apply to the project:

Goal EH-7 **Ensure that noise associated with the day-to-day activities of San Leandro residents and businesses does not impede the peace and quiet of the community.**

Policy EH-7.3 **Residential Exterior Noise Standard.** Strive to maintain an exterior noise level of no more than 60 dB Ldn in residential areas. Recognizing that some San Leandro neighborhoods already exceed the noise level, encourage a variety of noise abatement measures that benefit these areas.

Policy EH-7.7 **Noise Reduction Measures.** Encourage local businesses to reduce noise impacts on the community by replacing excessively noisy equipment and machinery, applying noise-reduction technology, and following operating procedures that limit the potential for conflicts.

Policy EH-7.9 **Vibration Impacts.** Limit the potential for vibration impacts from construction and ongoing operations to disturb sensitive uses such as housing and schools.

City of San Leandro Municipal Code

The City of San Leandro Municipal Code (City of San Leandro 2023) includes noise standards and regulations. The following sections of the Noise Ordinance are relevant to the analysis:

Section 4-1-115 of the San Leandro Municipal Code prohibits certain acts related to noise, such as construction-related noise near residential uses outside of the hours of 7 a.m. and 7 p.m. on weekdays and 8 a.m. and 7 p.m. on weekends. Noise within public parks and noise that conflicts with residential uses is also prohibited.

Neither the City of San Leandro nor the County of Alameda has specific and/or quantitative regulatory standards for construction or operational vibration sources. San Leandro Zoning Code Part IV, Article 16, Division 3, Provision 4-1670B, Vibration, requires that no use, activity, or process produce vibrations that are perceptible without instruments by a reasonable person at the property lines of a site. This performance standard applies to all land use classifications in all zoning districts.

Construction Noise Standards

While the City does not have specific noise level criteria for assessing construction noise impact, the Federal Transit Administration (FTA) has developed guidance for determining if construction of a project would expose various land uses to significant noise levels or if a project would result in a substantial temporary increase in noise levels (FTA 2018). Based on FTA guidance, a significant impact would occur if project-generated construction noise exceeds the 8-hour 80 dBA L_{eq} noise limit at nearby residences.

Groundborne Vibration Standards

Groundborne vibration of concern in environmental analysis consists of the oscillatory waves that move from a source through the ground to adjacent structures. While people have varying sensitivities to vibrations at different frequencies, in general they are most sensitive to low-frequency vibration. Vibration in buildings, such as from nearby construction activities, may cause windows, items on shelves, and pictures on walls to rattle.

Vibration sensitive receptors are similar to noise sensitive receptors, including residences and institutional uses such as schools, churches, and hospitals. However, vibration sensitive receptors also include buildings where vibrations may interfere with vibration-sensitive equipment. Vibration sensitive receptors near the site include industrial buildings adjacent to the project boundary to the north and west; industrial buildings 35 feet to the south and an industrial building 95 feet to the east; and single-family residential building 510 feet to the northeast of the project site.

Vibration limits used in this analysis to determine a potential impact to local land uses from construction activities, such as, vibratory compaction or excavation, are based on information contained in the 2018 FTA *Transit Noise and Vibration Impact Assessment Manual*. Groundborne vibration levels that could induce potential architectural damage to buildings are identified in Table 1. Based on FTA recommendations, limiting vibration levels to below 0.5 in/sec peak particle velocity (PPV) at Reinforced concrete, steel, or timber (no plaster) (which would apply to the nearby industrial building structures) would prevent architectural damage.

Table 1 Groundborne Vibration Architectural Damage Criteria

Building Category	PPV (in/sec)
I. Reinforced concrete, steel, or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

in/sec = inches per second; PPV = peak particle velocity
Source: FTA 2018

Project Impacts

Construction Noise

To determine construction noise impacts, noise was estimated using the Federal Highway Administration (FHWA) Roadway Construction Noise Model (RCNM) Version 1.1. Shown in Table 2, noise was modeled at the property line of the nearest residential noise-sensitive receivers from the closest property line of on-site construction activity.

Table 2 Estimated Noise Levels by Construction Phase

	L_{eq} dBA	
Construction Phase	RCNM Reference Noise Level[1] 50 feet	Residences to the Northeast (510 feet)
Demolition	82	62
Site Preparation	83	63
Grading	84	64
Building Construction	78	58
Paving	78	58

[1] RCNM reference noise levels are noise levels generated during each construction phase measured from a point 50 feet from the location of the construction phase.
Source: Roadway Construction Noise Model. See Attachment A for modeling outputs.

From the eastern boundary of the project site, the nearest noise-sensitive receivers include a single-family residence located approximately 510 feet northeast. As shown in Table 2, construction noise levels of up to 64 dBA L_{eq} during grading would not exceed the FTA residential daytime standard of 80 dBA $L_{eq\ (8\text{-hour})}$. Therefore, construction noise impacts would be less than significant.

Groundborne Vibration

Construction activities have the greatest potential to generate ground-borne vibration affecting nearby receptors, especially during paving of the project site. Construction activities known to generate excessive groundborne vibration, such as pile driving and blasting, would not be needed to construct the proposed project. The greatest vibratory source during construction in the project vicinity would be a roller used during paving. Construction vibration estimates are based on vibration levels reported by the FTA. Table 3 shows typical vibration levels for various pieces of construction equipment used in the assessment of construction vibration.

Table 3 Construction Vibration Levels

Equipment	in/sec PPV			
	Reference Level 25 feet	Industrial Buildings to the North and West 10 feet	Industrial Building to the South 35 feet	Industrial Building to the East 95 feet
Vibratory Roller	0.210	0.830	0.127	0.028
Large Bulldozer	0.089	0.352	0.054	0.012
Loaded Trucks	0.076	0.300	0.046	0.010
Small Bulldozer	0.003	0.198	0.030	0.007
Static Roller	0.050	0.012	0.002	<0.001
Threshold for Structural Damage to Building		0.5	0.5	0.5
Threshold Exceeded?		**Yes**	**No**	**No**

in/sec = inches per second; PPV = peak particle velocity

Notes: Vibration analysis worksheets are included in the Appendix to this report.

Source: FTA 2018

Based on the recommendations of the FTA, shown in Table 1, limiting vibration levels to below 0.5 in/sec PPV at industrial structures would prevent architectural damage regardless of building construction type. As provided by the client, the greatest anticipated source of vibration during project construction activities would be from a vibratory roller, which would be used during paving. Based on the project site plan, it is assumed the vibratory roller may be used within 10 feet of the nearest off-site industrial structures to the north and west of the project site during paving activities. A vibratory roller generates approximately 0.830 in/sec PPV at 10 feet, which would exceed the significance threshold of 0.5 inches per second (in/sec) PPV. Therefore, if uncontrolled, proposed project construction activities would have a significant impact on the generation or exposure of persons to excessive groundborne vibration. Other construction equipment would not exceed the threshold.

Operation of the proposed project would not include substantial sources of vibration. Therefore, the operation of the proposed project would have no impact on exposure to excessive groundborne vibration or groundborne noise levels.

Mitigation Measures

The following mitigation measure is recommended:

N-1 Construction Vibration Control Plan

For paving activities within 15 feet of the sensitive receptors to the north and west, use of a static roller in lieu of a vibratory roller shall be implemented. City staff shall verify that this requirement is incorporated into construction plans prior to issuance of a building permit.

Significance after Mitigation

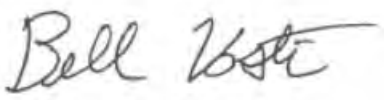
Mitigation N-1 would require that use of a static roller in lieu of a vibratory roller is used within 15 feet of off-site receptors to reduce construction-related vibration. Specifically, use of a static roller would generate vibration levels of approximately 0.05 in/sec PPV at a distance of 25 feet (McIver 2012). A static roller would generate approximately 0.198 in/sec PPV within 10 feet of sensitive receptors to the north and west. With implementation of Mitigation measure N-1, project groundborne vibration would be less than the significance threshold of 0.5 in/sec PPV at off-site sensitive receptors to the north and west. Therefore, with mitigation, project construction vibration impacts would be less than significant.

Traffic Noise

A project normally has a significant effect on the environment related to noise if it substantially increases the ambient noise levels for adjoining areas. Changes of less than 1 dBA are usually indiscernible. Changes of 1 to 3 dBA are detectable under quiet, controlled conditions. Most people can detect changes in sound levels of approximately 3 dBA under normal, quiet conditions. A change of 5 dBA is readily discernible to most people in an exterior environment. Therefore, less of an increase from roadway noise is allowed. Based on similar criteria from the Federal Aviation Administration (FAA), the following thresholds of significance are used to assess roadway vehicle noise impacts at sensitive receiver locations:

- Greater than 1.5 dBA CNEL increase for ambient noise environments of 65 dBA CNEL and higher;
- Greater than 3 dBA CNEL increase for ambient noise environments of 60-64 dBA CNEL;
- Greater than 5 dBA CNEL increase for ambient noise environments of less than 60 dBA CNEL and where the resulting future noise level would exceed 60 dBA CNEL.

Using information provided by Kimley Horn (Kimley Horn 2024), the proposed project would generate up to 1,543 new daily peak vehicle trips that would increase noise levels on nearby roadways. The proposed project would not make substantial alterations to roadway alignments or substantially change the vehicle classifications mix on local roadways. Therefore, the primary factor affecting off-site noise levels would be increased traffic volumes. The project's increase in traffic noise was estimated by adding the project daily trip generation to the existing average daily traffic (ADT) volume on the surrounding roadways analyzed in the City of San Leandro General Plan Update Draft EIR (City of San Leandro 2016b).



The existing ADT on Doolittle Road, between Adams Avenue to Davis Street, is 29,400. This addition of 1,543 daily vehicle trips would result in an increase in traffic noise that would be approximately 0.2 dBA CNEL. As stated in the City of San Leandro General Plan Update Draft EIR (City of San Leandro 2016b), the existing ambient noise level for Doolittle Drive, between Adams Avenue to Davis Street, is 71.8 dBA at 50 feet. A significant impact would occur if project-related traffic increases the 71.8 dBA ambient noise environment of noise-sensitive locations by 1.5 dBA or more. As the project would result in a traffic noise increase 0.2 dBA, the project's traffic noise increase would not exceed 1.5 dBA or more, and impacts would be less than significant.

This concludes the acoustical analysis and construction noise assessment for the subject project. If there are questions regarding the content of this letter report, please feel free to contact me.
