 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   378 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   1649000.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_2.5

 **Model Calculates  3 Short Term Average(s) of:   1-HR   8-HR  24-HR
     and Calculates PERIOD Averages

 **This Run Includes:    378 Source(s);       1 Source Group(s); and     326
Receptor(s)

                with:      1 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    377 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  18081

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
```

Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 5.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ;
Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 4.2 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: 880 Doolittle_Ops.err

**File for Summary of Results: 880 Doolittle_Ops.sum

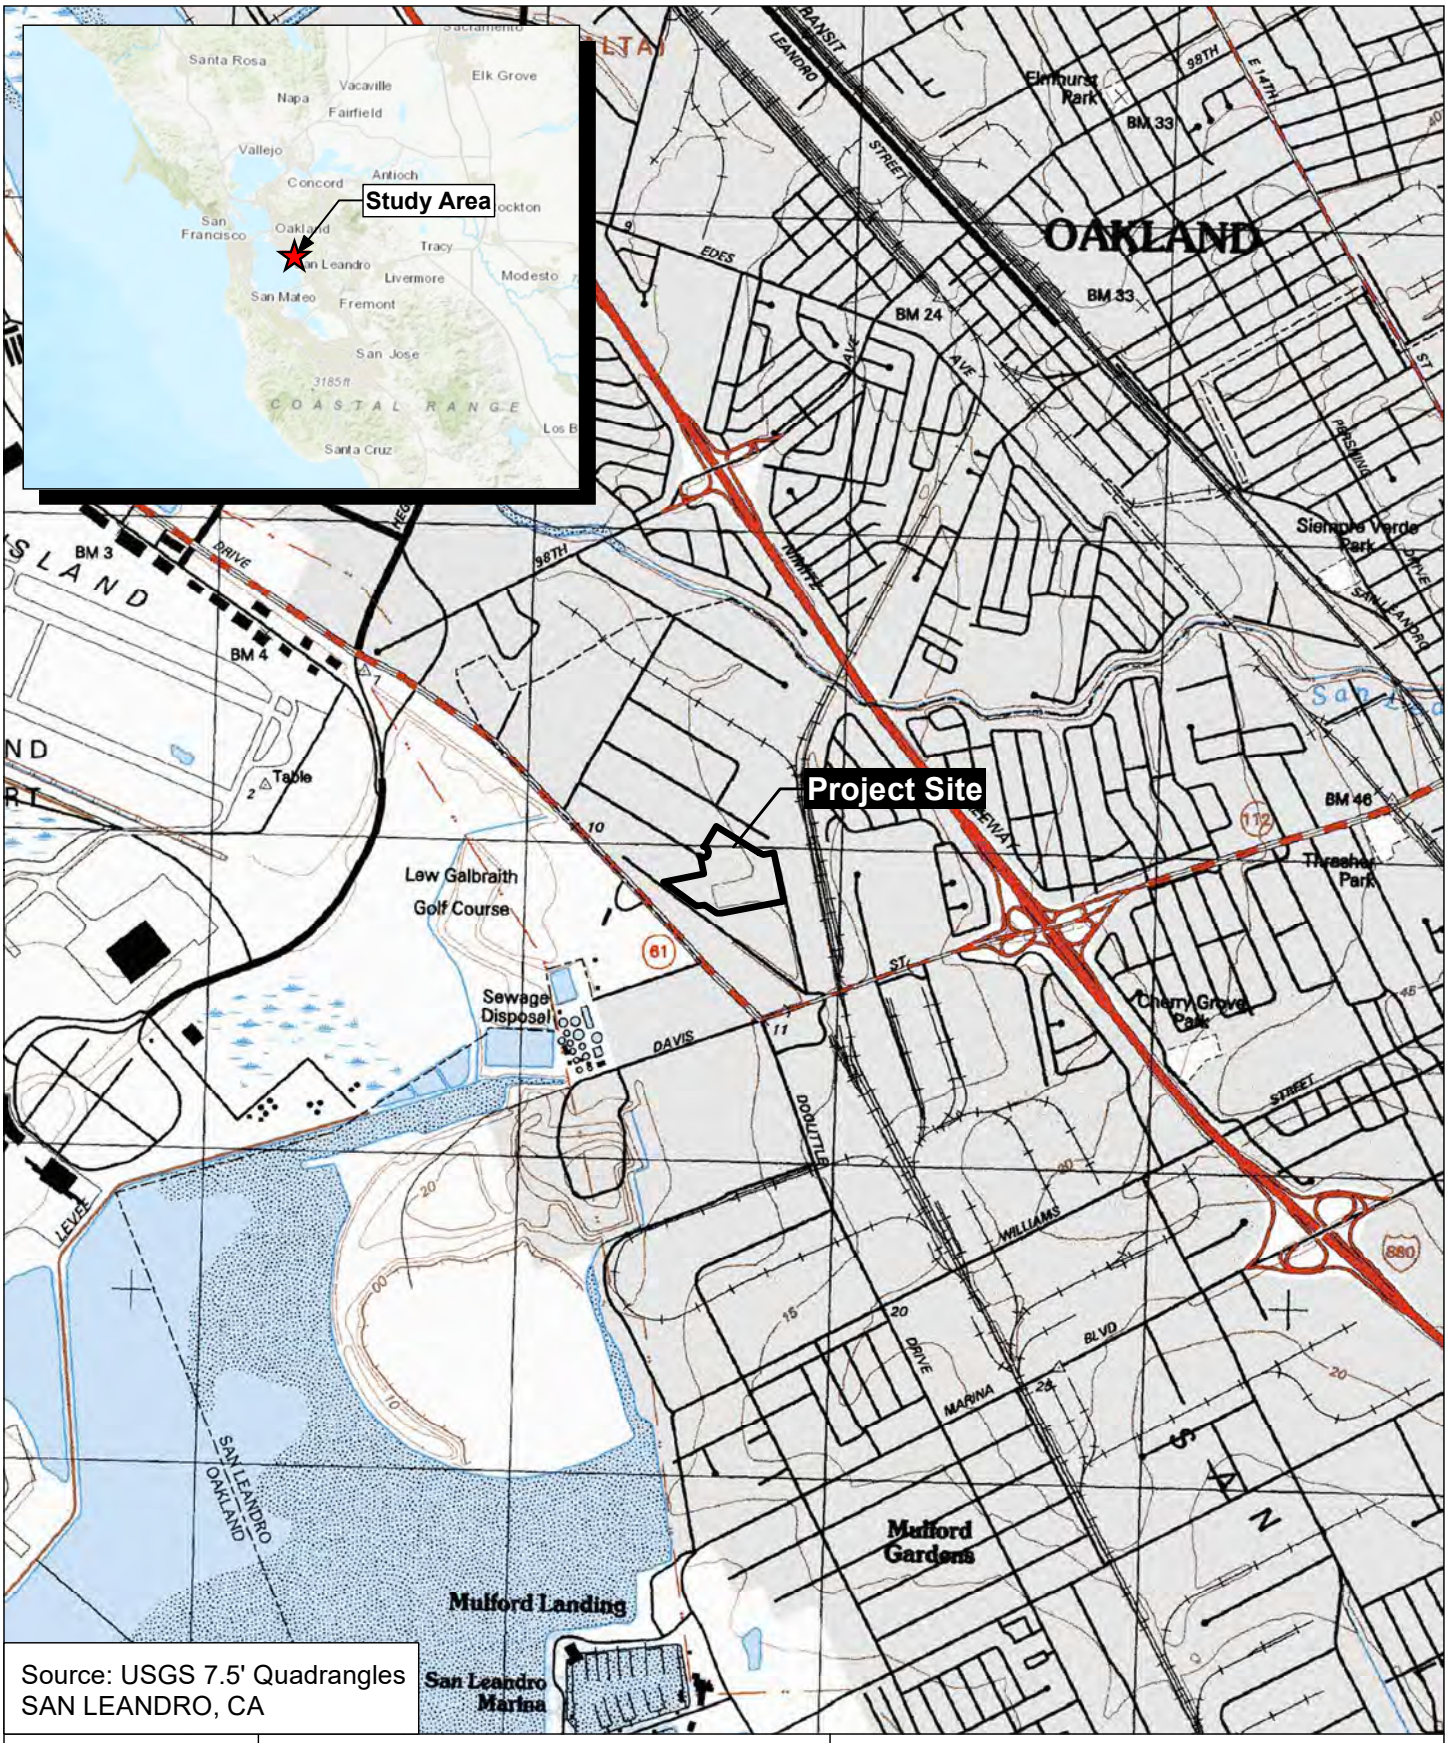
Biological Resources Assessment

MOORE BIOLOGICAL CONSULTANTS

October 27, 2023

Ms. Claudia Tarpin
Prologis
3353 Gateway Blvd.
Fremont, CA 94538

Subject: 14.4+/- ACRE “880 DOOLITTLE DRIVE” SITE, SAN LEANDRO, ALAMEDA COUNTY, CALIFORNIA: BIOLOGICAL ASSESSMENT



Dear Claudia:

Thank you for asking Moore Biological Consultants to prepare a Biological Assessment (BA) for this project in San Leandro, Alameda County, California (Figure 1). The purposes of this assessment are to describe existing biological resources in the project site, identify potentially significant impacts to biological resources from the project, and provide recommendations for how to reduce those impacts to a less-than-significant level. The work involved reviewing databases, aerial photographs, and documents, and conducting field a survey to document vegetation communities, wildlife habitats, potentially jurisdictional Waters of the U.S. and/or wetlands, and potentially suitable habitat for or presence of special-status species. This report details the methodology and results of our investigation.

Project Overview

Prologis LP, the project applicant, is proposing redevelopment of a 14.4+/-acre site in the City of San Leandro. The site comprised of two parcels located at the terminus of Hester Street and adjacent to Doolittle Drive, at 880 Doolittle Drive and 498 Hester Street (APNs # 77A-0741-004-02 and 77A-0741-005-00).

10330 Twin Cities Road, Suite 30 • Galt, CA 95632

The project site has a general plan land use designation of General Industrial and is zoned Industrial General (IG). The IG designation may contain a wide range of manufacturing, transportation, food and beverage processing, technology, warehousing, vehicle storage, office-flex, and distribution uses.

The proposed project would demolish four existing buildings and construct a single 239,573 square-foot warehouse building with a total building area of 244,573 square feet (see detailed Project Description and Plans in Attachment A). The proposed project would contain office and industrial uses and operate as a distribution and delivery station for a single tenant. The project also includes surface parking spaces, landscaping, and stormwater improvements.

Regulatory Framework

FEDERAL ENDANGERED SPECIES ACT: The Federal Endangered Species Act (FESA) of 1973 (16 U.S.C. 1531-1543) and subsequent amendments provide guidance for the conservation of endangered and threatened species and the ecosystems upon which they depend.

Section 7 of FESA requires Federal agencies, in consultation with and with the assistance of the Secretary of the Interior or the Secretary of Commerce, as appropriate, to ensure that actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of threatened or endangered species or result in the destruction or adverse modification of critical habitat for these species. The United States Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS) share responsibilities for administering the Act. Regulations governing interagency cooperation under Section 7 are found at 50 CFR Part 402. The opinions issued at the conclusion of consultation include statements authorizing take that may occur incidental to an otherwise legal activity.

CLEAN WATER ACT: The Clean Water Act (CWA) (33 U.S.C. 1251-1376) provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters. Section 404 of the CWA established a permit program administered by the U.S. Army Corps of Engineers (ACOE) regulating the discharge of dredged or fill material into waters of the United States (including wetlands). Implementing regulations by ACOE are found at 33 CFR Parts 320-330. Guidelines for implementation are referred to as the Section 404 (b)(1) Guidelines and were developed by the Environmental Protection Agency (EPA) in conjunction with ACOE (40 CFR Parts 230). The Guidelines allow the discharge of dredged or fill material into the aquatic system only if there is no practicable alternative that would have less adverse impacts.

State and federal agencies regulate Waters of the U.S. and wetlands, and Section 404 of the Clean Water Act requires that a permit be secured prior to the discharge of dredged or fill materials into any waters of the U.S., including wetlands. California Department of Fish and Wildlife (CDFW) also has jurisdiction over modifications to rivers, lakes, and streams under Section 1600 of Fish and Game Code of California (FGCC).

“Waters of the U.S.”, as defined in 33 CFR 328.4, encompasses Territorial Seas, Tidal Waters, and Non-Tidal Waters; Non-Tidal Waters includes interstate and intrastate rivers and streams, as well as their tributaries. The limit of federal jurisdiction of Non-Tidal Waters of the U.S. extends to the “ordinary high water mark”. The ordinary high water mark is established by physical characteristics such as a natural water line impressed on the bank, presence of shelves, destruction of terrestrial vegetation, or the presence of litter and debris.

Wetlands are vegetated areas that meet specific vegetation, soil, and hydrologic criteria defined by the ACOE *Wetlands Delineation Manual* and Regional Supplement (ACOE, 1987; 2008). Wetlands that are adjacent to and hydrologically very closely associated with jurisdictional lakes, rivers, streams, and tributaries can also fall under ACOE jurisdiction as “adjacent wetlands”.

Pursuant to a May 2023 Supreme Court decision, adjacent wetlands must have a continuous surface connection with a jurisdictional Water of the U.S. such that the wetland is indistinguishable from the adjacent water. Geographically and hydrologically isolated wetlands are outside federal jurisdiction, but some are regulated by RWQCB as a "Water of the State", as discussed below.

Jurisdictional wetlands and Waters of the U.S. include, but are not limited to, perennial and intermittent creeks and drainages, lakes, seeps, and springs; emergent marshes; riparian wetlands; and seasonal wetlands. Wetlands and Waters of the U.S. provide critical habitat components, such as nest sites and a reliable source of water, for a wide variety of wildlife species.

Section 401 of the CWA requires an applicant for a Federal license or permit that allows activities resulting in a discharge to waters of the U.S., to obtain a state certification that the discharge complies with other provisions of the CWA. The Regional Water Quality Control Board (RWQCB) administers the certification program in California.

MIGRATORY BIRD TREATY ACT: The Migratory Bird Treaty Act (MBTA) (16 USC, Section 703-711; 40 Stat. 755), as amended, prohibits killing, possessing, or trading in migratory birds except in accordance with regulations prescribed by the Secretary of the Interior. This act applies to whole birds, parts of birds, and bird nests and eggs. The MBTA does not provide protection for habitat of migratory birds, but does prohibit the destruction or possession of individual birds, eggs, or nest in active use without a permit from USFWS.

CALIFORNIA ENDANGERED SPECIES ACT: The California Endangered Species Act (CESA) (FGCC 2050 et seq.) establishes the policy of the State to conserve, protect, restore, and enhance threatened or endangered species and their habitats. CESA mandates that State agencies should not approve projects that would jeopardize the continued existence of threatened or endangered species, if reasonable and prudent alternatives are available that would avoid jeopardy.

CESA requires State lead agencies to consult with the during the California Environmental Quality Act **(**CEQA) process to avoid jeopardy to threatened or endangered species. As an outcome of consultation, CDFW is required to issue a written finding indicating if a project would jeopardize threatened or endangered species and specifying reasonable and prudent alternatives that would avoid jeopardy. The Act provides for joint consultations when species are listed by both the State and Federal governments.

PORTER-COLOGNE WATER QUALITY CONTROL ACT & WATERS OF THE STATE: Under the Porter-Cologne Water Quality Control Act, "Waters of the State" fall under the jurisdiction of the State Water Resource Control Board (SWRCB) and California Regional Water Quality Control Boards (RWQCBs). The RWQCBs are required to prepare and periodically update water quality control basin plans, which set forth water quality standards for surface water and groundwater, as well as actions to control non-point and point sources of pollution to achieve and maintain these standards.

Projects that affect Waters of the State may also be required to meet waste discharge requirements (WDRs) of the RWQCBs. SWRCB's Resolution 2008-0026 identified a need to protect Waters of the State that are not subject to CWA Section 404 permitting and associated CWA Section 401 Water Quality Certification. On May 28, 2020, the *State Wetland Definition and Procedures for the Discharges of Dredged or Fill Material to Waters of the State* went in to effect. The RWQCBs now issue WDRs for the fill of isolated wetlands that not subject to CWA Section 404 by issuing WDRs or in some cases, issues a WDR waiver.

CALIFORNIA ENVIRONMENTAL QUALITY ACT: With respect to biological resources, the CEQA Guidelines Section 15206 specifies that a project shall be deemed to be of statewide, regional, or area wide significance if it would substantially affect sensitive wildlife habitats, including but not limited to riparian lands, wetlands, bays, estuaries, marshes, and habitats for rare and endangered species.

CEQA Guidelines Section 15380 provides that a species not listed under FESA or CESA may be considered rare or endangered under specific criteria. These criteria have been modeled after the definitions in FESA and CESA. Section 15380 was included in the CEQA Guidelines primarily to deal with situations in which a public agency is reviewing a project that may have a significant effect on a candidate species that has not yet been listed by either USFWS or CDFW. Thus, Section 15380 provides an agency with the ability to protect a species from a project's potential impacts until the respective resource agencies have had an opportunity to designate the species as protected, if warranted.

An example would be the vascular plants listed as rare or endangered by the California Native Plant Society (CNPS), but which may have no designated status or protection under FESA or CESA. The CNPS created five lists:

- List 1A: Plants presumed extinct in California,
- List 1B: Plants rare, threatened, or endangered in California and elsewhere,
- List 2: Plants rare, threatened, or endangered in California, but more numerous elsewhere,
- List 3: Plants about which more information is needed; a "review list", and
- List 4: Plants of limited distribution; a "watch list".

Plants appearing on CNPS List 1A, 1B, or 2 are considered to meet the criteria of Section 15380; in rare cases, List 3 species may also meet the criteria.
FISH AND GAME CODE (SECTIONS 1600 AND 3503): Under Section 1600 of the FGCC, project proponents are required to notify CDFW prior to initiating activities for any project that would divert water from, or obstruct or change the natural flow, bed, channel, or bank of any river, stream, or lake. When an existing fish or wildlife resource may be substantially adversely affected, CDFW is required to propose reasonable project changes to protect the resource. These modifications are formalized in a Streambed Alteration Agreement.

Section 3503 of FGCC prohibits unlawful take, possession or needless destruction of the nest or eggs of any bird. Section 3503.5 of the FGCC states that it is "unlawful to take, possess, or destroy any birds-of-prey in the orders Falconiformes or Strigiformes . . ." (i.e., hawks, owls, eagles, and falcons). The loss of an active nest is considered a violation of this code by CDFW. This statute does not provide for the issuance of any type of incidental take permit.

Methods

Prior to the field survey, we conducted a search of California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB, 2020); an updated and expanded database search was conducted in October 2023 (CNDDB, 2023). The CNDDB search included the USGS 7.5-minute Oakland West, Oakland East, Las Trampas Ridge, Hunters Point, San Leandro, Hayward, San Mateo, Redwood Point and Newark topographic quadrangles, encompassing approximately 540 square miles surrounding the site. The USFWS IPaC Trust Report of Federally Threatened and Endangered species that may occur in or be affected by projects in the project vicinity was also reviewed (Attachment B). This information was used to identify wildlife and plant species that have been documented in the project vicinity or that may have the potential to occur if suitable habitat is present. We also reviewed the IPaC and USFWS on-line-maps of designated critical habitat.

A table of "Special-Status Species" pursuant to CEQA was compiled from the results of the database searches. Special-status species include species that are currently listed as threatened or endangered, or species that are candidates for listing at the state or federal level, rare plants, and animals considered sensitive by CDFW, as described above. Common species identified in the CNDDB were not included the Special-Status Species table.

A field survey was conducted on November 23, 2020. The survey consisted of walking throughout the site making observations of habitat conditions and noting

surrounding land uses, vegetation types, and plant and wildlife species. The survey included an assessment of the site for potentially jurisdictional Waters of the U.S. (a term that includes wetlands) as defined by the ACOE, 1987; 2008) and/or Waters of the State, including wetlands. The site was also searched for special-status species, and suitable habitat for special-status species (e.g., salt marshes, vernal pools). Trees along the edges of the site were assessed for the potential use by nesting raptors and the site was also searched for burrowing owls (*Athene cunicularia*) or ground squirrel burrows that could be utilized by burrowing owls.

An extensive visual search for bats was also conducted. Specifically, the inside and outside of the buildings and structures in the site were comprehensively searched with binoculars for suitable roosting crevices/areas for bats, or staining indicating recent or current bat utilization. The ground at the bases of the walls were also searched for guano deposits.

Results

GENERAL SETTING: The site is in San Leandro, in Alameda County, California. The site is in an Unnumbered Section, within Township 3 South, Range 3 West of the USGS 7.5-minute San Leandro topographic quadrangle (Figure 1). The site is essentially level and is situated at an elevation of approximately 10 feet above mean sea level. The site is completely developed and was used for airport parking until a few years ago when Amazon began using the site for van parking (Figure 2 and photographs in Attachment C).

This portion of San Leandro is primarily heavily industrial and commercial (see Figure 2). The site is bordered on all sides by industrial businesses and fully-developed properties. The cul-de-sac at the end of Hester Street provides access in to the northwest corner of the site, while a side street off of Doolittle Drive, situated just southwest of the site, is the main access road into the site.

AERIAL

880 Doolittle Drive

Town of San Leandro, Alameda County, CA

C:\EEC_INC\Projects\Moore Biological\880_Doolittle_Drive\MXD\880_doolittle_drive_aerial_figure_2.mxd

There are no aquatic habitats, riparian habitats, sensitive natural communities, wildlife movement corridors, or native wildlife nursery sites in the site. The site is not located in an area with an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

VEGETATION: Natural habitats in the project vicinity, including those in the site, have been almost completely converted to development and most of the site is paved. The only vegetation in the site is narrow fringes of highly disturbed ruderal grassland along fence lines and along the extreme edges of buildings within the site. Dominant grassland species in the site include oats (*Avena* sp.), common mallow (*Malva neglecta*), fireweed (*Epilobium brachycarpum*), prickly lettuce (*Lactuca serriola*), field bindweed (*Convolvulus arvensis*) and common sow thistle (*Sonchus oleraceus*).

The only trees in or immediately adjacent to the site are five ornamental trees in a landscaped strip around the cul-de-sac at the end of Hester Street. There are a couple of large trees a few hundred feet northwest of the site. The only other trees near the site are similar ornamental landscape trees scattered around businesses near the site.

WILDLIFE: Turkey vulture (*Cathartes aura*), rock dove (*Columba livia*), western gull (*Larus occidentalis*), yellow-rumped warbler (*Setophaga coronata*), and house finch (*Haemorhous mexicanus*) were the only birds observed in the site. The only trees near the site suitable for nesting raptors, despite being in such an urbanized area, is the eucalyptus trees located northwest of the west tip of the site. Given the presence a golf course nearby providing foraging and nesting opportunities, it is possible raptors and other protected migratory birds nest in trees near the site during some years. Songbirds could potentially nest in the ornamental trees along the edges of the site. Because the ruderal grassland areas in the site are very small and fragmented, they are unlikely to be used by nesting songbirds or ground-nesting birds.

No mammals or signs of mammals were observed in the site during the recent survey. As describe above, the buildings in the site were searched for bats, suitable roost habitat for bats, or sign of bats (i.e., guano). The buildings in the site are metal warehouses without attics that do not provide suitable roosting habitat for bats. No sign of bats was observed in the buildings.

Based on habitat types present, very few amphibians and reptiles have potential to occur in the site and none were observed. The site is within the range of Pacific chorus frog (*Pseudacris regilla*), western fence lizard (*Sceloporus occidentalis*), and gopher snake (*Pituophis melanoleucus*). Although considered highly unlikely, these and other common amphibian and reptile species may occur on-site on occasion.

WATERS OF THE U.S. AND WETLANDS: No vernal pools, seasonal wetlands, marshes, creeks, lakes, or any other areas meeting the technical and regulatory criteria of jurisdictional Waters of the U.S. or wetlands were observed in the site. There are also no areas in the site meeting the criteria of Waters of the State, including wetlands. Further, there are no areas within the site mapped as aquatic features in the National Wetland Inventory (NWI) (Attachment D).

SPECIAL-STATUS SPECIES: The likelihood of occurrence of listed, candidate, and other special-status species in the site is extremely low. Table 1 provides a summary of the listing status and habitat requirements of special-status species that have been documented in the greater project vicinity or for which there is potentially suitable habitat in the greater project vicinity. This table also includes an assessment of the likelihood of occurrence of each of these species in the site. The evaluation of the potential for occurrence of each species is based on the distribution of regional occurrences (if any), habitat suitability, and field observations.

SPECIAL-STATUS PLANTS: A total of 58 special-status plants were identified in the CNDDB (2023) search area, most of which are several miles from the site. A total

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
PLANTS						
San Mateo thorn-mint	*Acanthomintha duttonii*	E	E	1B	Chaparral, valley and foothill grassland (serpentine); elevations 165 – 985 feet; blooms April – June.	Unlikely: there is no suitable habitat in the site for San Mateo thorn-mint. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Franciscan onion	*Allium peninsulare var. franciscanum*	None	None	1B	Cismontane woodland, valley and foothill grassland; elevations 170-1,000 feet; blooms April – June.	Unlikely: there is no suitable habitat in the site for this species. The nearest record of Franciscan onion in the CNDDB (2023) is over 5 miles from the site.
Bent-flowered fiddleneck	*Amsinckia lunaris*	None	None	1B	Cismontane woodland, valley and foothill grassland, and coastal bluff scrub; elevations 10-1,640 feet; blooms March – June.	Unlikely: there is no suitable habitat in the site for bent-flowered fiddleneck. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Pallid manzanita	*Arctostaphylos pallida*	T	E	1B	Broadleafed upland forest, closed-cone coniferous forest, chaparral, cismontane woodland, and coastal scrub; elevations 605 – 1,525 feet; blooms December – March.	Unlikely: there is no suitable habitat in the site for pallid manzanita. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Coastal marsh milk-vetch	*Astragalus pycnostachyus var. pycnostachyus*	None	None	1B	Coastal dunes, marshes and swamps, and coastal scrub; elevations 0 – 180 feet; blooms June – October.	Unlikely: there is no suitable habitat in the site for coastal marsh milk vetch. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Alkali milk-vetch	*Astragalus tener var. tener*	None	None	1B	Alkali playas and vernal pools; elevations 5 – 195 feet; blooms March – June.	Unlikely: the site does not provide suitable habitat for this species. The nearest occurrence of alkali milk-vetch in the CNDDB (2023) search area is approximately 2 miles northwest of the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Big-scale balsamroot	*Balsamorhiza macrolepis*	None	None	1B	Chaparral, valley and foothill grassland and cismontane woodland; sometimes serpentine soils; elevations 150 – 5,100 feet; blooms March – June.	Unlikely: there is no suitable habitat in the site for big-scale balsamroot. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 3.5 miles east of the site.
Mt. Diablo fairy-lantern	*Calochortus pulchellus*	None	None	1B	Chaparral, cismontane woodland, riparian woodland, valley and foothill grassland; elevations 98-2,756 feet; blooms April – June.	Unlikely: the site does not provide suitable habitat for Mt. Diablo fairy-lantern. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Bristly sedge	*Carex comosa*	None	None	2B	Marshes and swamps, coastal prairie, valley and foothill grassland; elevations 0 – 2,050 feet; blooms May – September.	Unlikely: there is no suitable habitat in the site for this species. The nearest record of bristly sedge in the CNDDB (2023) is over 5 miles from the site.
Congdon's tarplant	*Centromadia parryi ssp. congdonii*	None	None	1B	Valley and foothill grassland within alkaline soils; elevations 0 – 755 feet; blooms May – October.	Unlikely: the site does not provide suitable habitat for Congdon's tarplant. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 1.5 miles southeast of the site.
Point Reyes salty bird's beak	*Chloropyron maritimum ssp. palustre*	None	None	1B	Coastal salt marsh; elevations 0 – 35 feet; blooms June - October.	Unlikely: there is no suitable habitat in the site for Point Reyes salty bird's beak. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 3 miles northwest of the site.
San Francisco Bay spineflower	*Chorizanthe cuspidata var. cuspidata*	None	None	1B	Coastal bluff scrub, coastal dunes, coastal prairie and coastal scrub; elevations 10 – 705; blooms April – July.	Unlikely: there is no suitable habitat in the site for San Francisco Bay spineflower. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Robust spineflower	*Chorizanthe robusta var. robusta*	E	None	1B	Coastal scrub, coastal dunes, openings in cismontane woodland, maritime chaparral; usually on sandy or gravelly soils; elevations 10 – 985 feet; blooms April – September.	Unlikely: the site does not provide suitable habitat for robust spineflower. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 4.5 miles northwest of the site. The site is not within designated critical habitat for this species (USFWS, 2002a).
Fountain thistle	*Cirsium fontinale var. fontinale*	E	E	1B	Valley and foothill grassland, chaparral, cismontane woodland and meadows and seeps; elevations 150 – 575 feet; blooms April – October.	Unlikely: there is no suitable habitat in the site for fountain thistle. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Presidio clarkia	*Clarkia franciscana*	E	E	1B	Coastal scrub, valley and foothill grassland; elevations 80 – 1,100 feet; blooms May – July.	Unlikely: there is no suitable habitat in the site for Presidio clarkia. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
San Francisco collinsia	*Collinsia multicolor*	None	None	1B	Closed-cone coniferous forest and coastal scrub; elevations 100 – 900 feet; blooms February – May.	Unlikely: there is no suitable habitat in the site for San Francisco collinsia. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Western leatherwood	*Dirca occidentalis*	None	None	1B	Broadleafed upland forest, closed-cone coniferous forest, coastal scrub, chaparral, and cismontane woodland; elevations 80 – 1,395; blooms January – April.	Unlikely: the site does not provide suitable habitat for western leatherwood. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 5 miles northeast of the site.
Tiburon buckwheat	*Eriogonum luteolum var. caninum*	None	None	1B	Valley and foothill grassland, chaparral, cismontane woodland, coastal prairie; in serpentine soils; elevations 0 – 2,295 feet; blooms May – September.	Unlikely: there is no suitable habitat in the site for Tiburon buckwheat. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
San Mateo woolly sunflower	*Eriophyllum latilobum*	E	E	1B	Cismontane woodland, coastal scrub and lower montane coniferous forest; elevations 150 – 1,085 feet; blooms May – June.	Unlikely: the site does not provide suitable habitat for San Mateo woolly sunflower. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Hoover's button-celery	*Eryngium aristulatum var. hooveri*	None	None	1B	Vernal pools; elevations 10-150 feet; blooms July – August.	Unlikely: there is no suitable habitat in the site for Hoover's button celery. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Jepson's coyote thistle	*Eryngium jepsonii*	None	None	1B	Valley and foothill grasslands, within vernal pools; elevations 10 – 985 feet; blooms April – August.	Unlikely: the site does not provide suitable habitat for Jepson's coyote thistle. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 4.5 miles southeast of the site.
San Joaquin spearscale	*Etriplex joaquiniana*	None	None	1B	Chenopod scrub, alkali meadow, valley and foothill grassland; within alkaline soils; elevations 3 – 2,672 feet; blooms April – October.	Unlikely: there is no suitable habitat in the site for San Joaquin spearscale. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Minute pocket moss	*Fissidens pauperculus*	None	None	1B	North coast coniferous forest in damp coastal soils; elevations 35 – 3,360 feet.	Unlikely: there is no suitable habitat in the site for minute pocket moss. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Hillsborough chocolate lily	*Fritillaria biflora var. ineziana*	None	None	1B	Cismontane woodland and valley and foothill grassland; elevation of 490 feet; blooms March – April.	Unlikely: the site does not provide suitable habitat for Hillsborough chocolate lily. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Fragrant fritillary	*Fritillaria liliacea*	None	None	1B	Coastal scrub, valley and foothill grassland and coastal prairie; often on serpentine soils; elevations 10 - 1,345 feet; blooms February – April.	Unlikely: there is no suitable habitat in the site for fragrant fritillary. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 3.5 miles east of the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Blue coast gilia	*Gilia capitata ssp. chamissonis*	None	None	1B	Coastal dunes and coastal scrub; elevations 5 – 655 feet; blooms April – June.	Unlikely: the site does not provide suitable habitat blue coast gilia. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Dark-eyed gilia	*Gilia millefoliata*	None	None	1B	Coastal dunes; elevations 5 – 100 feet; blooms April – June.	Unlikely: the site does not provide suitable habitat for dark-eyed gilia. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Diablo helianthella	*Helianthella castanea*	None	None	1B	Broad-leaved upland forest, chaparral, cismontane woodland, coastal scrub, riparian woodland, valley and foothill grassland; elevations 197- 4,265 feet; blooms March – June.	Unlikely: there is no suitable habitat in the site for Diablo helianthella. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 4 miles east of the site.
Congested-headed hayfield tarplant	*Hemizonia congesta ssp. congesta*	None	None	1B	Valley and foothill grassland; elevations 65 – 1,835 feet; blooms April – November.	Unlikely: the site does not provide suitable habitat for congested-headed hayfield tarplant. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Short-leaved evax	*Hesperevax sparsiflora var. brevifolia*	None	None	1B	Coastal bluff scrub, coastal dunes and coastal prairie; elevations 0 – 705 feet; blooms March – June.	Unlikely: there is no suitable habitat in the site for short-leaved evax. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Marin western flax	*Hesperolinon congestum*	T	T	1B	Chaparral, valley and foothill grassland (serpentinite); elevations 15 – 1,215 feet; blooms April – June.	Unlikely: the site does not provide suitable habitat for Marin western flax. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Water star-grass	*Heteranthera dubia*	None	None	2	Marshes and swamps (alkaline); elevations 100 – 4,905 feet; blooms July – October.	Unlikely: the site does not provide suitable habitat for water star-grass. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Loma Prieta hoita	*Hoita strobilina*	None	None	1B	Chaparral, cismontane woodlands and riparian woodlands; usually in serpentine soils; elevations 100 – 2,820 feet; blooms May – October.	Unlikely: there is no suitable habitat in the site for Loma Prieta hoita. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Santa Cruz tarplant	*Holocarpha macradenia*	T	E	1B	Coastal prairie, valley and foothill grassland; light sandy soil or sandy clay.	Unlikely: there is no suitable habitat in the site for Santa Cruz tarplant. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site. The site is not within designated critical habitat for this species (USFWS, 2002b).
Kellogg's horkelia	*Horkelia cuneata var. sericea*	None	None	1B	Closed-cone coniferous forest, costal scrub and dunes, and chaparral; elevations 35 – 655 feet; blooms April – September.	Unlikely: the site does not provide suitable habitat for Kellogg's horkelia. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 4.5 miles northwest of the site.
Contra Costa goldfields	*Lasthenia conjugens*	E	None	1B	Valley and foothill grassland within vernal pools and swales; elevations 0 – 1,540 feet; blooms March – June.	Unlikely: the site does not provide suitable habitat for Contra Costa goldfields. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site. The site is not in designated critical habitat for this species (USFWS 2005a).
Beach layia	*Layia carnosa*	T	E	1B	Coastal dunes and coastal scrub; elevations 0 – 195 feet; blooms March – July.	Unlikely: there is no suitable habitat in the site for beach layia. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Rose leptosiphon	*Leptosiphon rosaceus*	None	None	1B	Coastal bluff scrub; elevations 0 – 330 feet; blooms April – July.	Unlikely: the site does not provide suitable habitat for rose leptosiphon. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Crystal Springs lessingia	*Lessingia arachnoidea*	None	None	1B	Coastal sage scrub, valley and foothill grassland and cismontane woodland; elevations 195 – 655 feet; blooms July – October.	Unlikely: there is no suitable habitat in the site for Crystal Springs lessingia. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Arcuate bush-mallow	*Malacothamnus arcuatus*	None	None	1B	Chaparral and cismontane woodland; elevations 50 – 1,165 feet; blooms April – September.	Unlikely: there is no suitable habitat in the site for arcuate bush-mallow. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Oregon meconella	*Meconella oregana*	None	None	1B	Coastal prairie, coastal scrub; elevations 820 – 2,035 feet; blooms March – April.	Unlikely: the site does not provide suitable habitat for Oregon meconella. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Woodland woollythreads	*Monolopia gracilens*	None	None	1B	Chaparral, valley and foothill grassland and cismontane woodland; elevations 330 – 3,935 feet; blooms February – July.	Unlikely: the site does not provide suitable habitat for Woodland woollythreads. The nearest record of this species in the CNDDB (2023) search area is a large, nonspecific record centered over 5 miles from the site.
White-rayed pentachaeta	*Pentachaeta bellidiflora*	E	E	1B	Valley and foothill grassland; usually serpentine soils; elevations 115 – 2,035 feet; blooms March – May.	Unlikely: there is no suitable habitat in the site for white-rayed pentachaeta. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Choris' popcornflower	*Plagiobothrys chorisianus var. chorisianus*	None	None	1B	Chaparral, coastal scrub and coastal prairie; elevations 10 – 525 feet; blooms March – June.	Unlikely: the site does not provide suitable habitat for Choris' popcornflower. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
San Francisco popcornflower	*Plagiobothrys diffusus*	None	E	1B	Valley and foothill grassland and coastal prairie; elevations 195 – 1,180 feet; blooms March – June.	Unlikely: there is no suitable habitat in the site for San Francisco popcornflower. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Hairless popcorn-flower	*Plagiobothrys glaber*	None	None	1A	Meadows and seeps, marshes and swamps; elevations 50 – 590 feet; blooms March – May.	Unlikely: the site does not provide suitable habitat for hairless popcornflower. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Marin knotweed	*Polygonum marinense*	None	None	3	Marshes and swamps; elevations 0 – 35 feet; blooms April – October.	Unlikely: there is no suitable habitat in the site for Marin knotweed. The nearest record of this species in the CNDDB (2023) is a nonspecific record centered over 5 miles from the site.
Adobe sanicle	*Sanicula maritima*	None	R	1B	Meadows and seeps, valley and foothill grassland, chaparral and coastal prairie; elevations 100 – 785 feet; blooms February – May.	Unlikely: the site does not provide suitable habitat for adobe sanicle. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 4 miles northwest of the site.
Chaparral ragwort	*Senecio aphanactis*	None	None	2	Cismontane woodland, coastal scrub, within drying alkaline flats; elevations 49-2,625 feet; blooms January - April.	Unlikely: the site does not provide suitable habitat for chaparral ragwort. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Long-styled sand-spurrey	*Spergularia macrotheca var. longistyla*	None	None	1B	Marshes and swamps, meadows and seeps; elevations 0 – 835 feet; blooms February – May.	Unlikely: the site does not provide suitable habitat for long-styled sand-spurrey. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 2 miles northwest of the site.
Most beautiful jewelflower	*Streptanthus albidus ssp. peramoenus*	None	None	1B	Chaparral, valley and foothill grassland and cismontane woodland; elevations 310 – 3,280 feet; blooms March – October.	Unlikely: the site does not provide suitable habitat for most beautiful jewel flower. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 3 miles northeast of the site.
Northern slender pondweed	*Stuckenia filiformis ssp. alpina*	None	None	2	Marshes and swamps; elevations 985 – 7,055; blooms May – July.	Unlikely: the site does not provide suitable habitat for northern slender pondweed. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
California seablite	*Suaeda californica*	E	None	1B	Marshes and swamps; elevations 0 – 50 feet; blooms July – October.	Unlikely: there is no suitable habitat in the site for California seablite. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 1 mile southwest of the site.
Saline clover	*Trifolium hydrophilum*	None	None	1B	Marshes and swamps, mesic areas in valley and foothill grassland, vernal pools; elevations 0 – 985 feet; blooms April – June.	Unlikely: the site does not provide suitable habitat for saline clover. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 4 miles northwest of the site.
San Francisco owl's-clover	*Triphysaria floribunda*	None	None	1B	Coastal prairie, coastal scrub and valley and foothill grassland; elevations 35 – 525 feet; blooms April – June.	Unlikely: there is no suitable habitat in the site for San Francisco owl's-clover. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Oval-leaved viburnum	*Viburnum ellipticum*	None	None	2	Chaparral, cismontane woodland, and lower montane coniferous forest; elevations 705 – 4,593 feet; blooms May - June.	Unlikely: the site does not provide suitable habitat for oval-leaved viburnum. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
WILDLIFE						
Birds						
California Ridgway's rail	*Rallus obsoletus obsoletus*	E	E	N/A	Salt water and brackish marshes traversed by tidal sloughs in the San Francisco Bay; associated with pickleweed.	Unlikely: the site does not provide suitable habitat for this species. The nearest occurrence of California Ridgway's rail in the CNDDB (2023) search area is approximately 1 mile northwest of the site.
California least tern	*Sturnula antillarum browni*	E	E	N/A	Estuaries and bays; nests on exposed tidal flats or beaches	Unlikely: the site does not provide suitable habitat for California least tern. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 3 miles northwest of the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Western yellow-billed cuckoo	*Coccyzus americanus occidentalis*	T	E	N/A	Nests in riparian forests, along the broad, lower flood-bottoms of larger river systems.	Unlikely: the site does not provide suitable habitat for western yellow-billed cuckoo. There are no occurrences of this species in the CNDDB (2023) search area. The site is not in designated critical habitat for western yellow-billed cuckoo (USFWS, 2021).
Western snowy plover	*Charadrius alexandrinus nivosus*	T	None	N/A	Sandy beaches, salt pond levees and shores of large alkali lakes.	Unlikely: the site does not provide suitable habitat for western snowy plover. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 0.5 miles west of the site in the San Francisco Bay. The site is not in designated critical habitat for western snowy plover (USFWS 2012).
Tricolored blackbird	*Agelaius tricolor*	None	T	N/A	Open water and protected nesting substrate, usually cattails and riparian scrub.	Unlikely: the site does not provide suitable nesting habitat for tricolored blackbird. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Bank swallow	*Riparia riparia*	None	T	N/A	Nests colonially in riparian habitats; requires vertical banks and cliffs with fine-textured soils.	Unlikely: there is no suitable nesting habitat for this species in the site. The nearest record of bank swallow in the CNDDB (2023) is over 5 miles from the site.
California black rail	*Laterallus jamaicensis coturniculus*	None	T	N/A	Mainly inhabits salt marshes bordering larger bays.	Unlikely: the site does not provide suitable habitat for California black rail. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 2 miles northwest of the site.
Burrowing owl	*Athene cunicularia*	None	SC	N/A	Open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation.	Unlikely: no burrowing owls, ground squirrels, or ground squirrel burrows were observed in the site. The nearest occurrence of burrowing owls in the CNDDB (2023) search area is approximately 2 miles northwest of the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Yellow warbler	*Setophaga petechia*	None	SC	N/A	Nests in riparian areas, usually in willows, alders, and cottonwoods.	Unlikely: there is no suitable habitat in the site for yellow warbler. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Northern harrier	*Circus hudsonius*	None	SC	N/A	Costal salt and freshwater marsh; nests and forages in grasslands.	Unlikely: the site does not provide suitable habitat for northern harrier. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Black skimmer	*Rynchops niger*	None	None	SC	Nests on gravel bars, low islets and sandy beaches.	Unlikely: there is no suitable habitat in the site to support black skimmer. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Yellow rail	*Coturnicops noveboracensis*	None	SC	N/A	Fresh water marshlands, summer residence in eastern Sierra Nevada in Mono County.	Unlikely: the site does not provide suitable habitat for this species. The nearest occurrence of yellow rail in the CNDDB (2023) search area is approximately 2 miles northwest of the site.
Short-eared owl	*Asio flammeus*	None	SC	N/A	Winters in the Central Valley and utilizes annual grassland habitat and agricultural lands for foraging.	Unlikely: there is no suitable habitat for short-eared owl in the site. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Saltmarsh common yellowthroat	*Geothlypis trichas sinuosa*	None	SC	N/A	Fresh and saltwater marshes. Requires thick, continuous cover down to water surface for foraging.	Unlikely: the site does not provide suitable habitat for this species. The nearest occurrence of saltmarsh common yellowthroat in the CNDDB (2023) search area is approximately 2 miles northwest of the site.
Alameda song sparrow	*Melospiza melodia pusillula*	None	SC	N/A	Salt marshes bordering the south are of the San Francisco Bay.	Unlikely: the site does not provide suitable habitat for Alameda song sparrow. The nearest occurrence of this species in the CNDDB (2023) search area is just to the west of the site in the San Francisco Bay.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
White-tailed kite	*Elanus leucurus*	None	FP	N/A	Herbaceous lowlands with variable tree growth and dense population of voles.	Unlikely: the site does not provide suitable habitat for white-tailed kite. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Golden eagle	*Aquila chrysaetos*	None	FP	N/A	Nesting areas are associated with cliff-walled canyons and large trees. Forages in rolling hills and mountain areas.	Unlikely: the site does not provide suitable habitat for golden eagle. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Mammals						
Salt-marsh harvest mouse	*Reithrodontomys raviventris*	E	E	N/A	Saline emergent wetlands dominated by pickleweed.	Unlikely: the site does not contain suitable habitat for this species. The nearest occurrence of salt-marsh harvest mouse in the CNDDB (2023) search area is approximately 2 miles northwest of the site.
San Francisco dusky-footed woodrat	*Neotoma fuscipes annectens*	E	SC	N/A	Forest and woodland habitats; sometimes in chaparral and redwood habitats.	Unlikely: the site does not provide suitable habitat for San Francisco dusky-footed woodrat. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
American badger	*Taxidea taxus*	None	SC	N/A	Drier open stages of most shrub, forest, and herbaceous habitats, with friable soils	Unlikely: the site does not provide suitable habitat for American badger. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Western mastiff bat	*Eumops perotis californicus*	None	SC	N/A	Open, dry habitats with crevices in cliff faces, high buildings, trees and tunnels for roosting.	Unlikely: the site does not provide suitable habitat for western mastiff bat. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Townsend's big-eared bat	*Corynorhinus townsendii*	None	SC	N/A	Wide variety of habitats, most common in mesic sites; extremely sensitive to human disturbance.	Unlikely: the site does not provide suitable habitat for Townsend's big-eared bat. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Pallid bat	*Antrozous pallidus*	None	SC	N/A	Open and dry habitats with rocky areas for roosting.	Unlikely: the site does not provide suitable habitat for pallid bat. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Big free-tailed bat	*Nyctinomops macrotis*	None	None	N/A	Low-lying arid areas in southern California. Needs cliffs or rocky outcrops for roosting.	Unlikely: the site does not provide suitable habitat for big free-tailed bat. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Salt-marsh wandering shrew	*Sorex vagrans halicoetes*	None	None	SC	Salt marshes of the south are of San Francisco Bay.	Unlikely: the project site does not contain suitable habitat for this species. The nearest occurrences of salt-marsh wandering shrew in the CNDDB (2023) search area are approximately 2 miles west of the site.
Alameda island mole	*Scapanus latimanus parvus*	None	None	SC	Only known from Alameda Island; found in a variety of habitats, especially annual and perennial grasslands.	Unlikely: the site does not provide suitable habitat for Alameda Island mole. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 4 miles northwest of the site on Alameda Island.
Reptiles & Amphibians						
San Francisco gartersnake	*Thamnophis sirtalis tetrataenia*	E	E	FP	Vicinity of freshwater marshes, pond and slow-moving streams in San Mateo County and extreme northern Santa Cruz County.	Unlikely: the site does not provide suitable habitat for San Francisco gartersnake. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
California tiger salamander	*Ambystoma californiense*	T	T	N/A	Seasonal water bodies without fish (i.e., vernal pools and stock ponds) and grassland/ woodland habitats with summer refugia (i.e., burrows).	Unlikely: the site does not provide suitable habitat for California tiger salamander. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 4.5 northwest of the site. The site is not within designated critical habitat for California tiger salamander (USFWS, 2005b).

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
California red-legged frog	*Rana aurora draytonii*	T	SC	N/A	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation.	Unlikely: the site does not provide suitable habitat for California red-legged frog. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site. The site is not within designated critical habitat for this species (USFWS, 2006a).
Alameda whipsnake	*Masticophis lateralis euryxanthus*	T	T	N/A	Scrub, chaparral, grassland, and woodland habitat mosaics. South-facing slopes and ravines.	Unlikely: the site does not contain suitable habitat for Alameda whipsnake. The nearest record of this species in the CNDDB (2023) search area is approximately 4 miles north of the site. The site is not in designated critical habitat for Alameda whipsnake (USFWS, 2006b).
Foothill yellow-legged frog – central coast DPS	*Rana boylii pop. 4*	T	E	N/A	Perennial water bodies (i.e., streams and ponds) with abundant riparian vegetation.	Unlikely: there is no aquatic habitat in the site. The nearest record of foothill yellow-legged frog in the CNDDB (2023) is over 5 miles from the site.
Western pond turtle	*Emys marmorata*	None	SC	N/A	Ponds, marshes, streams, and ditches with emergent aquatic vegetation and basking areas.	Unlikely: the site does not contain suitable habitat for western pond turtle. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Fish						
Green sturgeon	*Acipenser medirostris pop.1*	T	None	N/A	Spawns in the Sacramento, Feather, and Yuba rivers. Non-spawning adults occupy marine/estuarine waters.	Unlikely there is no aquatic habitat in the site. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 1.5 miles southwest of the project site. The site is not in designated critical habitat for green sturgeon (NOAA, 2009).
Steelhead - Central California coast DPS	*Oncorhynchus mykiss irideus pop. 8*	T	None	N/A	Riffle and pool complexes with adequate spawning substrates within Central Valley drainages.	Unlikely there is no aquatic habitat in the site. The nearest record of steelhead in the CNDDB (2023) is over 5 miles from the site. The site is not within designated critical habitat for Central Valley steelhead (NOAA, 2005).

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Tidewater goby	*Eucyclogobius newberryi*	E	None	N/A	Coastal lagoons and the uppermost brackish water zones of larger estuaries.	Unlikely there is no aquatic habitat in the site. The nearest record of tidewater goby in the CNDDB (2023) is over 5 miles from the site. The site is not within designated critical habitat of this species (USFWS, 2008).
Longfin smelt	*Spirinchus thaleichthys*	None	SC	N/A	Brackish estuarine habitats.	Unlikely there is no aquatic habitat in the site. The nearest occurrence of longfin smelt in the CNDDB (2023) search area is within a mile southwest of the site.
Invertebrates						
Myrtle's silverspot butterfly	*Speyeria zerene myrtleae*	E	None	N/A	Restricted to foggy, coastal dunes and hills of the Point Reyes Peninsula; larval foodplant thought to be *Viola adunca*.	Unlikely: the site does not provide suitable habitat for this species. The nearest record of Myrtle's silverspot butterfly in the CNDDB (2023) is over 5 miles from the site.
Vernal pool fairy shrimp	*Branchinecta lynchi*	T	None	N/A	Vernal pools.	Unlikely there are no vernal pools in the site. There are no occurrences of this species in the CNDDB (2023) search area. The site is not within designated critical habitat of vernal pool fairy shrimp (USFWS 2005a).
Bay checkerspot butterfly	*Euphydryas editha bayensis*	T	None	N/A	Restricted to native grasslands on outcrops of serpentine soil in the vicinity of San Francisco Bay.	Unlikely: the site does not provide suitable habitat for Bay checkerspot butterfly. The nearest occurrence of this species in the CNDDB (2023) search area is approximately 4 miles northeast of the project site.
Monarch – California overwintering population	*Danaus plexippus pop. 1*	C	None	N/A	Variety of habitats in California; monarch larvae dependent on milkweed.	Unlikely: the site does not provide suitable habitat for monarch butterfly; no milkweed was observed in the site. The nearest record of this species in the CNDDB (2023) search area is approximately 1 mile southwest of the site.

TABLE 1

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED OR POTENTIALLY-OCCURRING IN THE PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[2]	CNPS List[3]	Habitat	Potential for Occurrence in the Project Site
Crotch bumble bee	*Bombus crotchii*	None	CE	N/A	Open grassland and scrub habitats throughout California; rarely found in the Central Valley.	Unlikely: the site does not provide suitable habitat for Crotch bumble bee. The nearest record of this species in the CNDDB (2023) is over 5 miles from the site.
Western bumble bee	*Bombus occidentalis*	None	CE	N/A	Meadows and grasslands with abundant floral resources, usually found in high elevation.	Unlikely: the site is completely developed and does not provide suitable habitat for western bumble bee. The nearest record of this species in the CNDDB (2023) search area is approximately 2.5 miles east of the site.

1 T= Threatened; E = Endangered; C = Candidate for listing.

2 T = Threatened; E = Endangered; CE = Candidate for Endangered Status; FP = Fully Protected Species; R = Rare; SC=State of California Species of Special Concern.

3 CNPS List 1A includes species that are considered extinct in California; List 1B includes species that are rare, threatened, or endangered in California and elsewhere; List 2 includes plants that are rare, threatened or endangered in California but are more common elsewhere; List 3 is a review list of species for which more information is needed; List 4 is a watch list.

of 16 special-status plants are located within five miles from the site: alkali milk-vetch (*Astragalus tener var. tener*), big-scale balsamroot (*Balsamorhiza macrolepis*), Congdon's tarplant (*Centromadia parryi spp. congdonii*), Point Reyes salty bird's beak (*Chloropyron maritimum ssp. palustre*), robust spineflower (*Chorizanthe robusta var. robusta*), western leatherwood (*Dirca occidentalis*), Jepson's coyote-thistle (*Eryngium jepsonii*), fragrant fritillary (*Fritillaria biflora var. ineziana*), Diablo helianthella (*Helianthella castanea*), Kellogg's horkelia (*Horkelia cuneata var. sericea*), adobe sanicle (*Sanicula maritima*), long-styled sand-spurrey (*Spergularia macrotheca var. longistyla*), most beautiful jewelflower (*Streptanthus albidus ssp. peramoenus*), California seablite (*Suaeda californica*), and saline clover (*Trifolium hydrophilum*). The USFWS IPaC Trust Report includes a few of these same species and also contains California seablite and Contra Costa goldfields (*Lasthenia conjugens*).

Special-status plants generally occur in relatively undisturbed areas in vegetation communities such as vernal pools, marshes and swamps, chenopod scrub, seasonal wetlands, riparian scrub, and areas with unusual soils. The project site is completely developed and essentially void of vegetation. Due to a lack of suitable habitat, it is highly unlikely that any special-status plants occur in the project site.

SPECIAL-STATUS WILDLIFE: The potential for intensive use of the site by special-status wildlife species is extremely low. A total of 40 special-status wildlife species are recorded in the CNDDB (2023) query, with 17 of which have been found within 5 miles of the site. These species include: California Ridgway's rail (*Rallus obsoletus obsoletus*), California least tern (*Sturnula antillarum browni*), California black rail (*Laterallus jamaicensis coturniculus*), western snowy plover (*Charadrius alexandrinus nivosus*), burrowing owl, yellow rail (*Coturnicops noveboracensis*), saltmarsh common yellowthroat (*Geothlypis trichas sinuosa*), Alameda song sparrow (*Melospiza melodia pusillula*), salt-marsh harvest mouse (*Reithrodontomys raviventris*), salt-marsh wandering shrew (*Sorex vagrans halicoetes*), Alameda island mole (*Scapanus latimanus parvus*), California tiger

salamander (*Ambystoma californiense*), Alameda whipsnake (*Masticophis lateralis euryxanthus*), green sturgeon (*Acipenser medirostris*), longfin smelt (*Spirinchus thaleichthys*), Bay checkerspot butterfly (*Euphydryas editha bayensis*), monarch butterfly (*Danaus plexippus*), and western bumble bee (*Bombus occidentalis*).

Western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) and vernal pool fairy shrimp (*Branchinecta lynchi*) are the two additional species that are not recorded in the CNDDB within the search area, but are on the USFWS IPaC Trust Report (Attachment B).

While the project site may have provided habitat for special-status wildlife species at some time in the past, development has substantially modified natural habitats in the greater project vicinity, including those within the site. The site does not provide suitable habitat for any of the special-status species identified in Table 1. It is unlikely that special-status wildlife species occur in the site, primarily due to a lack of suitable habitat.

A few special-status bird species may fly over the site on occasion, but are not be expected to nest in the site or utilize the site more than for occasional perching. Most notably, the site is completely developed and surrounded by industrial and commercial parcels on all sides and does not contain natural habitats necessary for bird nesting such as marsh and beach habitat. Additionally, there are no trees large enough in the site for nesting raptors and there is no suitable burrow habitat in the site for nesting burrowing owl.

The paved site does not provide suitable habitat for any of the special-status rodents in Table 1 including salt-marsh harvest mouse, salt-marsh wandering shrew, and Alameda island mole. The site also does not provide suitable habitat for special-status bats or other special-status mammalian species such as San Francisco dusky-footed woodrat and American badger.

The site does not provide aquatic habitat for California red-legged frog, California tiger salamander, San Francisco gartersnake, western pond turtle, and foothill yellow-legged frog or the mosaic of scrub, chaparral, grassland, and woodland habitats required by Alameda whipsnake. The site does not provide suitable habitat for other special-status reptile or amphibian species.

The site does not provide aquatic habitat for Central Valley steelhead, green sturgeon, tidewater goby, longfin smelt, or other special-status fish.

There are no vernal pools or seasonal wetlands in the site for vernal pool fairy shrimp. The site also does not provide suitable habitat for Myrtle's silverspot butterfly or Bay checkerspot butterfly. Finally, the site lacks the floristic resources needed to support bee species.

CRITICAL HABITAT: The site is not in designated critical habitat of western yellow-billed cuckoo (USFWS, 2021), western snowy plover (USFWS 2012), California red-legged frog (USFWS, 2006a), Alameda whipsnake (USFWS, 2006b), federally listed vernal pool shrimp or plants (USFWS, 2005a), California tiger salamander (USFWS, 2005b), Alameda whipsnake (USFWS, 2006b), robust spineflower (USFWS, 2002a), Santa Cruz tarplant (USFWS, 2002b), green sturgeon (NOAA, 2009), tidewater goby (USFWS, 2008), or any other federally listed species (Attachment E).

WILDLIFE MOVEMENT CORRIDORS: Well-developed riparian corridors are often utilized for movement by wildlife species such as deer, coyote, red fox (*Vulpes vulpes*), and bobcat (*Felis rufus*), as well as a variety of amphibians, reptiles, and fish. There are no wildlife movement corridors in the site.

HABITAT CONSERVATION PLANS: The site is not located in an area with an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Impact Analysis and CEQA Checklist

A review of the six questions regarding the level of the project impacts to biological resources follows:

A. *Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?* No. No special-status plants or potentially suitable habitat for special-status plants was observed in the site. No special-status wildlife species have potential to occur in the site on more than a transitory or very occasional basis.

B. *Would the project Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?* No. The site is biologically unremarkable. There is no riparian habitat in the site. There are no sensitive natural communities in the site.

C. *Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?* No. No potentially jurisdictional Waters of the U.S. or wetlands of any type were observed in the site. There are also no areas in the site meeting the criteria of Waters of the State, including wetlands.

D. *Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife*

nursery sites? No. There are no riparian habitats or other wildlife movement corridors, or native wildlife nursery sites in the site.

E. *Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?* No. The only trees in or immediately adjacent to the site are five ornamental landscape trees.

F. *Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?* No. The site is not located in an area with an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Conclusions and Recommendations

- The site is paved and is essentially void of vegetation. There are no aquatic habitats, riparian habitats, sensitive natural communities, wildlife movement corridors, or native wildlife nursery sites in the site; the site is biologically unremarkable.

- There are no potentially jurisdictional Waters of the U.S. or wetlands in the site. There are also no areas in the site meeting the criteria of Waters of the State, including wetlands

- Due to a lack of suitable habitat, it is extremely unlikely that special-status plants occur in the site. No special-status plants were observed and none are expected to occur in the site.

- Due to a lack of suitable habitat and location of the site in an infill area, it is unlikely that special-status wildlife species occur in the site.

- The site is not within designated critical habitat for any federally listed species.

- The site is not located in an area with an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

- If project activities, including, but not limited to, staging of materials, tree or vegetation removal, and demolition work, are conducted during nesting bird season (February 15 - September 15), preconstruction nest surveys shall be conducted in and near the project (within 250 feet for large raptors and 100 feet for all other birds) by a qualified biologist within 7 days of the start of construction. Survey shall include, but not be limited to, ground, trees, shrubs, and building areas. If nesting birds are identified during the preconstruction survey, then the project shall be modified (i.e., a no-work exclusion buffer of appropriate size [to be determined by the biologist] shall be erected around active nests) and/or delayed in specific areas, as necessary, to avoid impacts to the identified nests, eggs, and/or young.

We hope this information is useful. Please call me at (209) 745-1159 with any questions.

Sincerely,

Diane S. Moore, M.S.
Principal Biologist

Attachment A

Project Description & Plans

Project Description – 880 Doolittle Drive

Project Introduction and Location

Prologis LP, the project applicant, is proposing to demolish the existing warehouses and construct a new warehouse on the approximately 14.14-acre property located at 880 Doolittle Drive (APNs # 77A-0741-004-02 and 77A-0741-005-00) in the City of San Leandro (City).

Surrounding Area and Existing Conditions

The project site is bounded by commercial development on the west, north, and east. The southern boundary comprises an existing railroad with commercial development beyond. There are existing commercial use buildings on-site with associated surface parking. The only on-site landscaping are five trees along the northwestern site boundary at Hester Street. Access is currently provided via two existing driveways. A driveway along the site's southwestern boundary provides access from Doolittle Drive and a driveway on the site's northwestern boundary provides exit-only movements from Hester Street. There are existing sidewalks along the Hester Street driveway. There is no pedestrian access from Doolittle Drive. There are Class II bikeways along Doolittle Drive and Adams Avenue.

The project site has a general plan land use designation of General Industrial (IG) and is zoned Industrial General (IG). The IG designation may contain a wide range of manufacturing, transportation, food and beverage processing, technology, warehousing, vehicle storage, office-flex, and distribution uses. The IG zone permits new storage or wholesale/retail distribution facility warehouse uses with the approval of a conditional use permit (CUP).

Proposed Project Characteristics

The proposed project would demolish the existing 211,213[1] square feet of industrial warehouse on-site and construct an approximately 239, 573 square foot (sf) new warehouse[2]. The new warehouse will be a modern facility that would comprise approximately 229,573 sf of warehouse use and 15,000 sf of office use, of which 5,000 sf of office use would be mezzanine level. Sixty-four loading docks would be constructed as part of the proposed warehouse, 27 on the north side and 37 on the southside of the building. The project will be designed to attract a wide variety of tenants. Prologis is exploring the use of environmental friendly construction materials such as Cross Laminated Timber (CLT) in the office space..

The proposed floor area ratio (FAR) is 0.40 and the maximum building height would be 50 feet with an interior clear height of 40 feet. The warehouse would be positioned within the project site to comply with the City minimum frontage setback requirement of 10 feet.

The project proposes several surface improvements, including new landscaping and reconfigured parking areas. The reconfigured parking amounts to 203 automobile parking spaces and 59 trailer parking spaces. Per City requirements (Municipal Code Section 2.12.320), proposed landscaping would comprise five percent of the project site.

---

[1] The existing industrial warehouse building is 206,243 sq. ft and there is an adjacent ancillary office building of 4,970 sq ft, totally 211,213 of industrial use on-site.

[2] The proposed building footprint would be approximately 239,573 sf; there would be an additional 5,000 sf of mezzanine office space within the building footprint for a total of 244,573 sf of usable space.

Project access would be provided via three driveways. The two existing driveways (at Doolittle Drive and Hester Street) would be maintained and a third driveway would be added from Hester Street. Both driveways providing access from Hester Street would be 40 feet wide and all driveways would meet minimum width requirements based on intended use.

The General Plan land use designation of General Industrial is intended to contain a wide range of manufacturing, transportation, food and beverage processing, technology, warehousing, vehicle storage, office-flex, and distribution uses. The project has been designed for consistency with the General Plan, compliance with the requisite zoning standards and guidelines, and substantial compliance with the Site Plan Review Standards and findings. Consistent with the intended use called for in the General Plan, the project would develop a warehouse for future tenant use. The proposed warehouse would also be in compliance with the IG zoning of the project site, with approval of a CUP.

Sustainability Features

Prologis LP, the project applicant, has recently set a companywide goal of achieving net zero carbon emissions by 2040. On site power generation, vehicle electrification and carbon reduction are important goals for Prologis. As part of this effort, the proposed building will be solar ready, utilize LED lights, pursue LEED certification, and include equipment for 21 on-site electric vehicle charging stalls to be installed at a future date. Prologis will also target LEED Silver Certification.

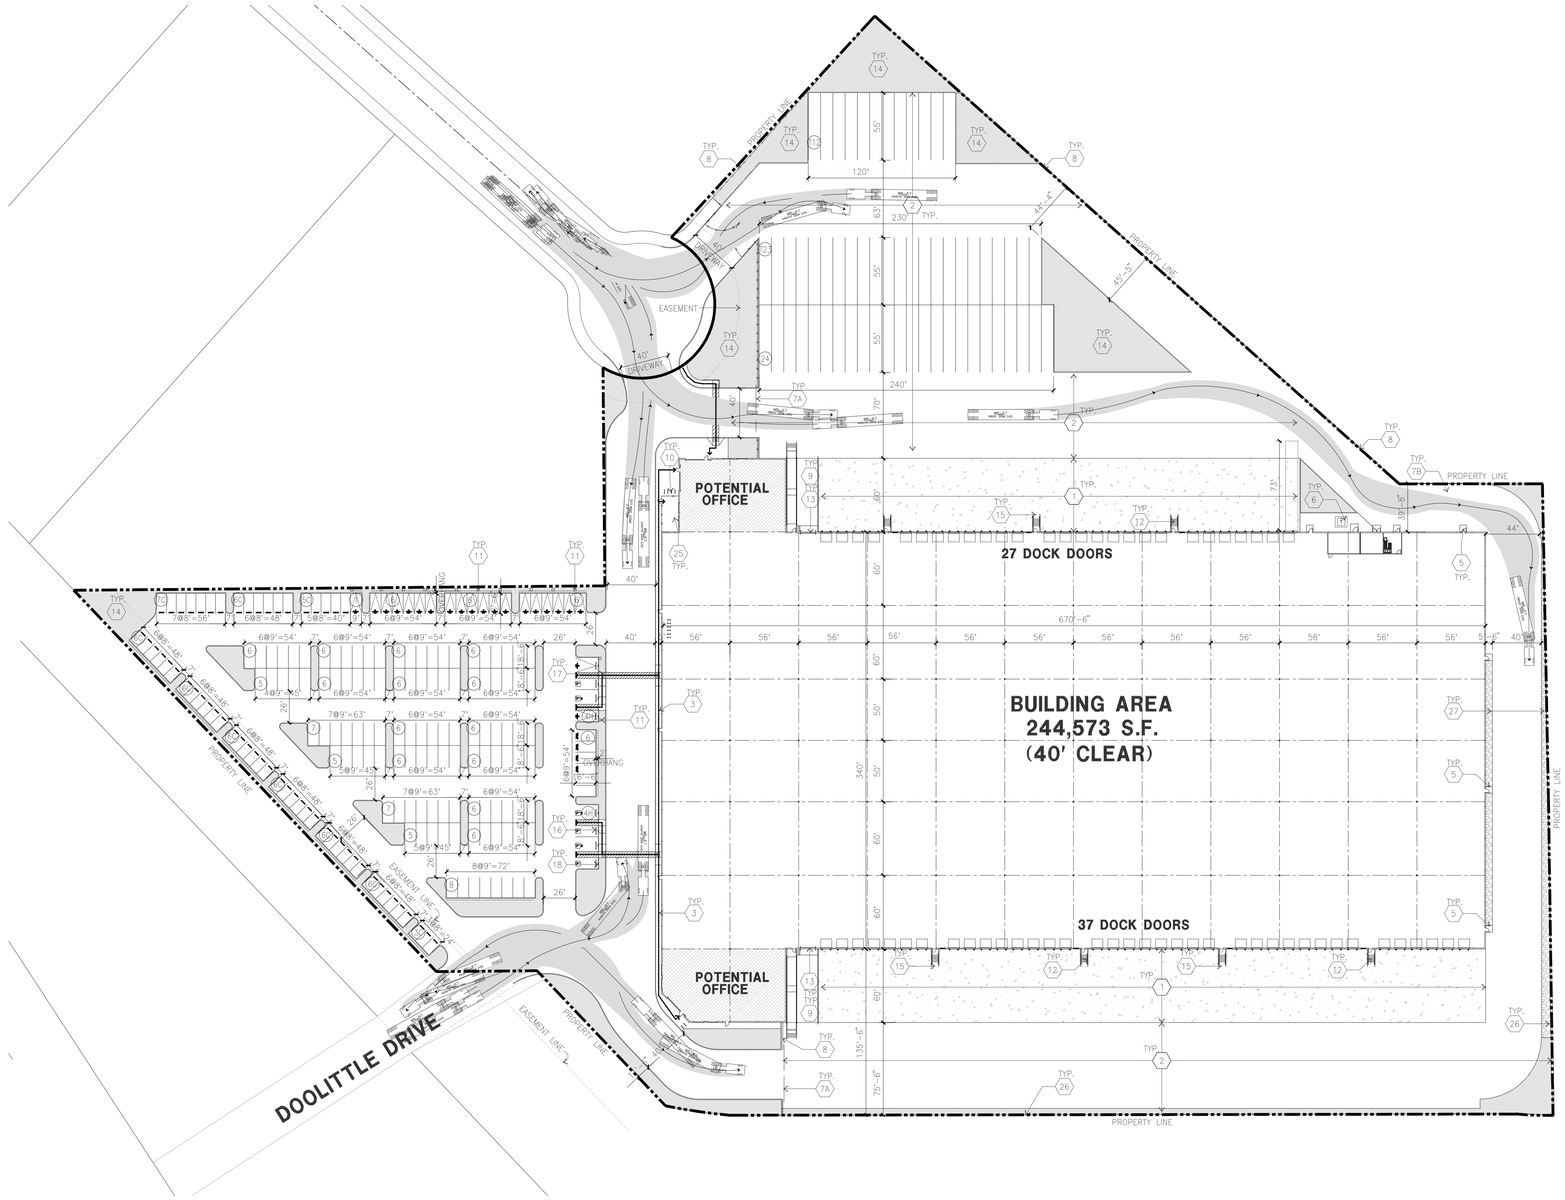
Existing Zoning and Proposed Land Use

At the time of publishing, no tenant has been identified for this site, however the project is intended for occupancy by uses consistent with the site's IG General Plan designation, as well as those uses permitted under the site's IG zoning classification. See Table 1: Permitted Zoning Uses below summarizing the potential uses for the proposed project.

Table 1: Permitted Zoning Uses

	Industrial General	
Use Classification	IG	Classification Description, per San Leandro Zoning Code 1.12.108
Building Materials and Services	P	Retailing, wholesaling, or rental of building supplies or equipment. This classification includes lumber yards, tool and equipment sales or rental establishments, plumbing supply businesses, and building contractors' yards, but excludes establishments devoted exclusively to retail sales of paint, hardware, wall coverings, furniture, decorations, electronics, appliances, and home improvement sales, and activities classified under Vehicle/Equipment Repair and Sales classifications, including vehicle towing services
Equipment Sales	P	The sale of large products for commercial and industrial use, e.g. x-ray machines, photocopy machines, etc.
Food Processing, General	P	Establishments engaged in the manufacturing or processing of food or beverages for consumption and wholesale distribution where the processing of food is primarily from raw materials or involves complex food packaging. This classification includes breweries and establishments where the food processing may involve noxious or unpleasant odors.

Food Processing, Limited	P	Food Processing, Limited. Establishments engaged in the manufacturing or processing of food or beverages for consumption and wholesale distribution where the processing of food is primarily from previously prepared foodstuffs or is limited in nature. This classification excludes establishments where the food processing involves noxious or unpleasant odors.
Industry, Custom	P	Establishments primarily engaged in on-site production of goods by hand manufacturing involving the use of hand tools and small-scale equipment.
Industry, General	P	Manufacturing of products, primarily from extracted or raw materials, or bulk storage and handling of such products and materials. Uses in this classification typically involve a high incidence of truck or rail traffic, and/or outdoor storage of products, materials, equipment, or bulk fuel. This classification includes chemical manufacture or processing, laundry and dry cleaning plants, and auto dismantling within an enclosed building. This classification excludes the processing of recycled materials as a facility regulated by Section 4.04.232 Recycling Facilities.
Industry, Research and Development	P	Establishments primarily engaged in the research, development, and controlled production of high-technology electronic, industrial or scientific products or commodities for sale, but excludes uses that may be objectionable as determined by the Zoning Enforcement Official, by reason of production of offensive odor, dust, noise, vibration, or storage of or risk associated with hazardous materials. Uses include biotechnology firms, metallurgy, optical, pharmaceutical and x-ray research, data processing, and non-toxic computer component manufacturers
Parcel Processing and Shipping Centers*	P/AR	Establishments for the processing and/or re-distribution of parcels or products, including but not limited to air and ground cargo receiving and distribution centers. This classification includes “Parcel Processing and Shipping Facilities” that provide incidental warehousing, but excludes “Truck Terminals” and parcel processing that is accessory to industrial, manufacturing or warehousing uses.
Warehouse - Storage Facilities**	P/UP	Distribution and warehousing facilities, such as order-processing fulfillment centers, logistics business, and other facilities that provide for the shipment of an on-site inventory of goods and products directly to retail/wholesale customers or retail stores. This classification includes facilities for the repackaging of consumer goods for shipment to retail stores. (This classification excludes warehousing activity accessory to an industrial and/or manufacturing use, and also excludes “Truck Terminals” and “Parcel Processing and Shipping Centers” with incidental warehousing.)
Warehouse - Wholesale/Retail Distribution***	P/UP	Warehousing facilities primarily used for the storage and/or consolidating of items such as raw materials, private goods, and the intermediary storage of bulk goods intended for further distribution. This classification includes moving and furniture storage companies. (This classification excludes warehousing activity accessory to an industrial and/or manufacturing use and, also, excludes “Truck Terminals” and “Parcel Processing and Shipping Centers” with incidental warehousing.)



*Pursuant to Zoning Code sections 2.12.200(A)(30) and 2.12.228, a Parcel Processing and Shipping Center is subject to Administrative Review in order to occupy 30,000 SF or more, in a building constructed after August 15, 2001.

**Pursuant to Zoning Code section 2.12.200(A)(36), Warehouse-Storage Facilities require a Conditional Use Permit if an existing building is expanded more than 10,000 SF, or if a new building is proposed.

***Pursuant to Zoning Code section 2.12.200(A)(37), Warehouse - Wholesale/Retail Distribution require a Conditional Use Permit if an existing building is expanded more than 10,000 SF, or if a new building is proposed.

California Environmental Quality Act (CEQA) Compliance

There is an open State Water Resources Control Board cleanup case on the project site. This cleanup case is considered a Cortese List site. Thus, the project cannot utilize a Categorical Exemption (per CEQA Guidelines Section 15300.2 [e]) and will require CEQA evaluation beginning with an Initial Study.

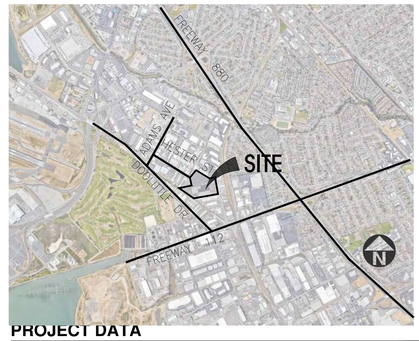
24. EXTERIOR TRASH ENCLOSURE
25. OUTDOOR BREAK AREA
26. EXISTING FENCE
27. GRAVEL, SEE CIVIL DRAWINGS



SITE PLAN GENERAL NOTES

1. THE SITE PLAN BASED ON THE SOILS REPORT PREPARED BY GEOTECHNICAL ENGINEER, DATE, PROJECT NUMBER #
2. IF SOILS ARE EXPANSIVE IN NATURE, USE STEEL REINFORCING FOR ALL SITE CONCRETE
3. ALL DIMENSIONS ARE TO THE FACE OF CONCRETE WALL, FACE OF CONCRETE CURB OR GRID LINE U.N.O.
4. SEE "C" PLANS FOR ALL CONCRETE CURBS, GUTTERS AND SWALES
5. PROVIDE STRUCTURAL CALCULATION AND CONSTRUCTION ANCHORAGE DETAIL FOR TRANSFORMER PRIOR TO INSTALLATION.
6. SEE "C" DRAWINGS FOR POINT OF CONNECTIONS TO OFF-SITE UTILITIES. CONTRACTOR SHALL VERIFY ACTUAL UTILITY LOCATIONS.
7. PROVIDE POSITIVE DRAINAGE AWAY FROM BLDG. SEE "C" DRAWINGS.
8. CONTRACTOR TO REFER TO "C" DRAWINGS FOR ALL HORIZONTAL CONTROL DIMENSIONS. SITE PLANS ARE FOR GUIDANCE AND STARTING LAYOUT POINTS.
9. SEE "C" DRAWINGS FOR FINISH GRADE ELEVATIONS.
10. CONCRETE SIDEWALKS TO BE A MINIMUM OF 4" THICK W/ TOOLED JOINTS AT 6' O.C. EXPANSION/CONSTRUCTION JOINTS SHALL BE A MAXIMUM 12' EA. WAY W/ 1:20 MAX. SLOPE. EXPANSION JOINTS TO HAVE COMPRESSIVE EXPANSION FILLER MATERIAL OF 1/4". FINISH TO BE A MEDIUM BROOM FINISH
11. U.N.O. PROVIDE KNOX BOXES AT ALL OFFICE ENTRANCES.
12. PAINT CURBS AND PROVIDE SIGNS TO INFORM OF FIRE LANES AS REQUIRED BY FIRE DEPARTMENT.
13. ON-SITE FIRE MAIN, FIRE SPRINKLER, AND SPRINKLER MONITORING SYSTEM SHALL BE SUBMITTED SEPARATELY TO THE FIRE DEPARTMENT FOR REVIEW AND PERMITTING.
14. ALL VERTICAL MOUNTING POLES OF FENCING SHALL BE CAPPED.
15. LANDSCAPED AREAS SHALL BE DELINEATED WITH A MINIMUM SIX INCHES (6") HIGH CURB
16. ALL INTERIOR AND EXTERIOR WALK SURFACES TO BE NON-SLIP TYPE

SITE LEGEND

- CONCRETE PAVING. SEE "C" DRWGS. FOR THICKNESS
- LANDSCAPED AREA
- STANDARD PARKING STALL (9' X 16.5') W/ 2 FT OVERHANG
- CLEAN AIR/VANPOOL/EV CONDUIT STUB FOR FUTURE EV
- CLEAN AIR/ VANPOOL/EV WITHOUT CONDUIT STUB FOR FUTURE EV
- COMPACT PARKING STALL 8' X 15'
- ACCESSIBLE PARKING STALL (9' X 18.5') + 5' W/ ACCESSIBLE AISLE
- ACCESSIBLE PARKING (VAN) STALL (12' X 18.5') + 5' W/ ACCESSIBLE AISLE
- ACCESSIBLE PATH OF TRAVEL MIN. WIDTH TO BE 48" SLOPE NOT TO EXCEED 5% IN THE DIRECTION OF TRAVEL AND CROSS SLOPE NOT TO EXCEED 2 % . SEE CIVIL DRAWINGS FOR GRADING PLAN

KEYNOTES - FLOOR PLAN

1. CONCRETE TILT-UP PANEL.
2. STRUCTURAL STEEL COLUMN.
3. TYPICAL STOREFRONT SYSTEM WITH GLAZING. SEE ENLARGED PLANS AND ELEVATIONS FOR SIZES, COLOR AND LOCATIONS.
4. CONCRETE RAMP W/ 4.2" HIGH CONC TILT-UP GUARD WALL OR BUILDING WALL ON BOTH SIDES OF RAMP.
5. 9' X 10' DOCK DOOR, SECTIONAL O.H., STANDARD GRADE. DESIGNED TO RESIST CITY REQUIRED WIND SPEED.
6. EXTERIOR CONCRETE STAIR AND GUARDRAIL PAINTED METAL HANDRAIL
7. 5'-6"X5'-6"X4" THICK CONCRETE EXTERIOR LANDING PAD TYPICAL AT ALL EXTERIOR MAN DOORS TO LANDSCAPED AREA. FINISH TO BE MEDIUM BLOOM FINISH. SLOPE TO BE 1/4" : 12" MAX.
8. 4'X8' METAL LOUVER.
9. DOCK DOOR BUMPER.
10. 12' X 14' DRIVE THRU, SECTIONAL O.H., STANDARD GRADE. DESIGNED TO RESIST CITY REQUIRED WIND SPEED.
11. 3' X 7' HOLLOW METAL EXTERIOR MAN DOOR. DESIGNED TO RESIST CITY REQUIRED WIND SPEED.
12. CONC. FILLED GUARD POST, 6" DIA. U.N.O., 48"H.
13. EXTERIOR DOWNSPOUT WITH OVERFLOW SCUPPER.
14. INTERIOR ROOF DRAIN & OVERFLOW SCUPPERS.
15. INTERIOR ROOF DRAIN WITH PIPED OVERFLOW.
16. Z GUARD.
17. LONG TERM BIKE RACK. SEE TABULATION FOR CALCULATION. SEE DAB-AD.1 FOR ENLARGED PLAN AND DETAILS
18. ELECTRICAL ROOM.
19. METAL CANOPY ABOVE.
20. ROOF ACCESS LADDER.
21. FIRE PUMP ROOM.
22. CONCRETE STAIR / RAMP WITH BLACK POWDER COATED METAL GUARD RAIL AND HANDRAIL TO COMPLY WITH CBC 11B

GENERAL NOTES - FLOOR PLAN

1. THIS BUILDING IS DESIGNED FOR HIGH PILE STORAGE WITH FIRE ACCESS MAN DOORS AT 125' O.C. MAX. A SEPARATE PERMIT WILL BE REQUIRED FOR ANY RACKING/CONVEYER SYSTEMS. INSURE HEAT AND SMOKE VENTS AS REQ'D COMPLY WITH TABLE 910.3 CBC
2. FIRE HOSE LOCATIONS SHALL BE APPROVED PER FIRE DEPARTMENT.
3. SEE "C" DRAWINGS FOR FINISH SURFACE ELEVATIONS.
4. WAREHOUSE INTERIOR CONCRETE WALLS ARE PAINTED WHITE. COLUMNS ARE TO RECEIVE PRIMER ONLY. ALL GYP. BD. WALLS IN WAREHOUSE TO RECEIVE 1 COAT OF WHITE TO COVER.
5. THE BUILDING FLOOR SLAB IS FLAT/SLOPED, SEE CIVIL.
6. SLOPE POUR STRIP 1/2" TO EXTERIOR AT ALL MANDOOR EXITS. SEE "S" DRAWINGS FOR POUR STRIP LOCATION.
7. PROVIDE 6" DIA. CONCRETE BOLLARD AT ALL FIRE RISER AND UNPROTECTED INTERIOR ROOF DRAIN.
8. ALL DIMENSIONS ARE TO THE FACE OF CONCRETE PANEL WALL, GRIDLINE, OR FACE OF STUD U.N.O.
9. SEE CIVIL DRAWINGS FOR POINT OF CONNECTIONS TO OFF-SITE UTILITIES. CONTRACTOR TO VERIFY ACTUAL UTILITY LOCATIONS. PLUMBING/ELECTRICAL COORDINATION.
10. FOR DOOR TYPES AND SIZES, SEE DETAIL SHEET A5.1. NOTE: ALL DOORS PER DOOR SCHEDULE ARE FINISH OPENINGS.
11. CONTRACTOR TO PROTECT AND KEEP THE FLOOR SLAB CLEAN. ALL EQUIPMENT TO BE DIAPERED INCLUDING CARS AND TRUCKS.
12. ALL EXIT MAN DOORS IN WAREHOUSE TO HAVE ILLUMINATED EXIT SIGN HARDWARE.
13. HIGHLY FLAMMABLE AND COMBUSTIBLE MATERIAL SHALL NOT BE USED OR STORED IN THIS BUILDING.
14. PROVIDE FIRE EXTINGUISHERS AT LOCATIONS DETERMINED BY FIRE DEPARTMENT.
15. EACH EXTERIOR EXIT DOOR SHALL BE IDENTIFIED BY A TACTILE EXIT SIGN WITH THE WORDS "EXIT". THE MOUNTING HEIGHT FOR SUCH SIGNAGE SHALL BE 60" FROM FINISH FLOOR LEVEL TO THE CENTER OF THE SIGN.
16. AFFIX AN INTERNATIONAL ACCESSIBILITY SYMBOL ON ALL ACCESSIBLE ENTRANCES PER CBC 11B-216.6
17. ALL INTERIOR AND EXTERIOR WALKING SURFACES TO BE NON-SLIP TYPE

FLOOR SLAB AND POUR STRIPS REQ.

THESE NOTES ARE VERY MIN. REQUIREMENT. SEE "S" DWGS FOR ADDITIONAL REQUIREMENTS

1. FLOOR COMPACTION – 95%
2. TRENCH COMPACTION – 90%
3. BUILDING FLOOR SLAB: SEE STRUCTURAL DRAWINGS FOR DETAILS.
4. CONTRACTOR TO BUILD FOR CLASS V FLOOR PER A.C.I. 302-R-96
5. CONCRETE SLAB TO HAVE STEEL FLOAT HARD TROWEL BURNISHED FINISH.
6. CONTRACTOR TO CURE SLAB TO BE WET CURING USING BURLINE FOR 7 DAYS MIN.
7. ALL EQUIPMENT & MOVING VEHICLES SHALL BE DIAPERED.
8. NO CRANES, CONCRETE TRUCKS, OR ANYTHING HEAVIER WILL BE PLACED ON THE SLAB.
9. SLAB TO BE FF50 FL35 MEASURED WITHIN 24 HOURS.
10. NO FLY ASH IN THE CONCRETE
11. WHERE [ ] INDICATED, PROVIDE VAPOR BARRIER (15 MIL STEGO OR EQUAL) CONFORMING TO ASTM E 1745 UNDER THE CONCRETE SLAB. PROVIDE SAND PER SOILS ENGINEER OR MANUFACTURER'S RECOMMENDATION. CONCRETE SLAB IN OFFICE AREAS, WHERE SAND OVER VISQUEEN ARE REQUIRED, SHALL BE NATURALLY HYDRATED WITHOUT USE OF BURLENE, CURING COMPOUND, OR RELEASE AGENTS.
12. SEAL CONCRETE SLAB W/ "LAPIDOLITH" SEALER
13. SHURESEAL/LAPIDOLITH OR APPROVED EQUAL FLOOR SEALER APPLIED ONE COAT AT END OF JOB IN ACCORDANCE WITH MANUFACTURER'S RECOMMENDATION.
14. NO PERMANENT GREASE PEN PANEL MARKS ON FLOOR SLAB. NO RED CAULK MARKS. ALL CONSTRUCTION MARKS TO BE REMOVED BEFORE SEALING.
15. 10' POUR STRIP AT TRUCK DOOR, 4FT. MAX. ELSEWHERE.
16. ALL FLOOR SLAB NAIL OR BRACE FRAME HOLES FILLED WITH APPROVED 2 PART EPOXY COMPOUND TO MATCH CONCRETE COLOR. PECA BOND LV 2000,BURKE EPOXY INJECTION RESIN OR EQUAL.
17. PROVIDE FIRE EXTINGUISHERS PER FIRE DEPARTMENT REQUIREMENT.
18. MM-80 AT SPEED BAY ONLY, PRICE AS ADDITIONAL ALTERNATE

PAINT NOTES

INTERIOR GYP. BD. WALLS : SINGLE COAT OF ACRYLIC PAINT FRAZEE "WHITE" ON INTERIOR WALLS.

ALL STRUCTURAL STEEL MEMBER INC. COLUMNS, LEDGERS, JOISTS, & GIRDERS SHALL HAVE LIGHT GRAY SHOP PRIMER.

INTERIOR STEEL COLUMNS : PAINT OSHA YELLOW 10' A.F.F. ABOVE 12' APPLY ONE COAT OF WHITE PAINT

PIPE BOLLARDS SHALL HAVE TWO COATS OF ENAMEL "OSHA YELLOW".

EXTERIOR CONCRETE WALLS WILL HAVE ONE COAT OF PRIMER AND ONE FINISH COAT OF PAINT.

ALL EXTERIOR HOLLOW METAL DOORS AND DOCK DOORS TO HAVE ONE COAT OF EXTERIOR PRIMER AND TWO COATS OF ACRYLIC PAINT TO MATCH ADJACENT SURFACE COLORS. PIPE STEEL HANDRAILS SHALL HAVE TWO COATS OF LATEX PAINT.

KEYNOTES - ELEVATIONS

1. CONCRETE TILT-UP PANEL(PAINTED).
2. PANEL JOINT.
3. PANEL REVEAL.
4. OVERHEAD DOOR @ DRIVE THRU. PROVIDE COMPLETE WEATHER-STRIPPING PROTECTION ALL AROUND.
5. OVERHEAD DOOR @ DOCK HIGH. PROVIDE COMPLETE WEATHER-STRIPPING PROTECTION ALL AROUND.
6. EXTERIOR CONCRETE STAIR / RAMP WITH METAL GUARDRAIL AND HANDRAIL
7. METAL LOUVER. PAINT TO MATCH BUILDING COLOR.
8. HOLLOW METAL DOORS.
9A. EXTERIOR DOWNSPOUT WITH OVERFLOW SCUPPERS.
9B. INTERIOR ROOF DRAIN AND OVERFLOW SCUPPER.
9C. INTERIOR ROOF DRAIN WITH PIPED OVERFLOW
10. DOCK BUMPER.
11. ALUMINUM STOREFRONT FRAMING WITH TEMPERED GLAZING.
12. METAL TUBE STEEL CANOPY
13. TOP OF ROOF LINE BEYOND
14. EXTERIOR CONCRETE STAIR AND GUARDRAIL, METAL HANDRAIL.
15. TRASH ENCLOSURE
16. ROOF LINE

GENERAL NOTES - ELEVATIONS

A. ALL PAINT COLOR CHANGES TO OCCUR AT INSIDE CORNERS UNLESS NOTED OTHERWISE.
B. ALL PAINT FINISHES ARE TO BE FLAT UNLESS NOTED OTHERWISE.
C. T.O.P. EL.= TOP OF PARAPET ELEVATION.
D. F.F. = FINISH FLOOR ELEVATION.
E. STOREFRONT CONSTRUCTION: GLASS, METAL ATTACHMENTS AND LINTELS SHALL BE DESIGNED TO RESIST CITY REQUIRED WIND SPEED, EXPOSURE C. WINDS. CONTRACTOR SHALL SUBMIT SHOP DRAWINGS PRIOR TO INSTALLATION.
F. CONTRACTOR SHALL FULLY PAINT SEVERAL CONCRETE PANEL W/ SELECTED COLORS. LOCATION TO BE SELECTED BY ARCHITECT, ARCHITECT AND OWNER SHALL APPROVE PRIOR TO PAINTING REMAINDER OF BUILDING.
G. BACK SIDE OF PARAPETS TO HAVE SMOOTH FINISH AND BE PAINTED WITH ELASTOMERIC PAINT.
H. FOR SPANDREL GLAZING, ALLOW SPACE BEHIND SPANDREL TO BREATH.
J. USE ADHESIVE BACK WOOD STRIPS FOR ALL REVEAL FORMS.
K. THE FIRST COAT OF PAINT TO BE ROLLED-ON AND THE SECOND COAT TO BE SPRAYED-ON.
L. EXTERIOR STAIRS AND RAMPS TO MATCH BUILDING COLOR. RAILINGS TO MATCH BUILDING COLOR.
M. ALL DOORS TO BE PAINTED THE SAME COLOR AS THE ADJACENT WALL.

BIO SWALE GRASSES

BIO-SWALE NATIVE GRASS TO BE "NATIVE PRESERVATION SEED MIX" AS AVAILABLE FROM DELTA BLUEGRASS CO. OR EQUAL. TEMPORARY IRRIGATION TO BE PROVIDED FOR ESTABLISHMENT IF REQUIRED BY TIME OF YEAR TO BE PLANTED.

IRRIGATION

ALL IRRIGATION IS TO BE POINT SOURCE DRIP OR DEEP ROOT BUBBLER IRRIGATION PROVIDED PER PANT. IRRIGATION WILL MEET THE MWELO AND ARTICLE 19 OF THE ZONING CODE. IRRIGATION PLANS AND DETAILS TO BE SUBMITTED WITH PERMIT DRAWINGS.

LANDSCAPE CALCULATIONS

TOTAL SITE AREA : 616,401 S.F. (14.15 ACRES)
LANDSCAPE AREA REQUIRED (5% OF SITE): 30,820 S.F.
LANDSCAPE AREA PROVIDED (7%): 41,592 S.F.
TOTAL AUTO PARKING SPACES PROVIDED: 205
PARKING AREA TREES REQUIRED 1/6 SPACES: 34
PARKING AREA TREES PROVIDED: 45

WATER EFFICIENT LANDSCAPE REQUIREMENTS

ALL IRRIGATION EITHER PERMANENT OR TEMPORARY
SHALL BE AUTOMATIC TIMER CONTROLLED. PERMANENTLY
IRRIGATED SHRUBS AND TREES SHALL BE DRIP IRRIGATED.
AUTOMATIC CONTROLLER w/ ET DATA, REPEAT CYCLING
IRRIGATION ZONES PER PLANT WATER REQUIREMENTS
RAIN SENSOR SENSOR TO BE SPECIFIED
SOIL AMENDMENTS TO BE INCORPORATED
PLANTER SURFACE AREAS TO BE MULCHED
WATER USAGE TO MEET STATE WATER EFFICIENT LANDSCAPE STANDARD

I HAVE COMPLIED WITH THE CRITERIA OF THE MODEL WATER EFFICIENT LANDSCAPE ORDINANCE AND APPLIED THEM FOR THE EFFICIENT USE OF WATER IN THE LANDSCAPE AND IRRIGATION DESIGN PLANS.

880 DOOLITTLE PRELIMINARY HYDROZONE INFORMATION TABLE

Please complete the hydrozone table(s) for each hydrozone. Use as many tables as necessary to provide the square footage of landscape area per hydrozone.

Table reflects irrigated areas only. Rock areas with no plant material and non-irrigated seeded bio-swales. are excluded in the landscape square footage.

Hydrozone*	Zone or Valve	Irrigation Method**	Area (Sq. Ft.)	% of Landscape Area
LW Trees and Shrubs High Density	Project Accent Planting	Drip/Bubbler	1,011	8%
LW Trees and Shrubs Med Density	Parking Lot Planting	Drip/Bubbler	7,220	20%
LW Shrubs Low Density	Screen/Foundation Planting	Drip	7,598	27%
LW Bio-Retention	Seeded native grasses	Spray	25,763	45%
	Total		41,592 sq.ft.	100%

Hydrozone
HW = High Water Use Plants
MW = Moderate Water Use Plants
LW = Low Water Use Plants
VLW= Very Low Water Us –Non Irrigated
Trees are assumed a 40 s.f. area for watering each.

Maximum Applied Water Allowance Calculations for New and Rehabilitated Non-Residential Landscapes

IPaC **U.S. Fish & Wildlife Service**

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

Alameda County, California

Local offices

San Francisco Bay-Delta Fish And Wildlife

(916) 930-5603
(916) 930-5654

650 Capitol Mall
Suite 8-300
Sacramento, CA 95814

Sacramento Fish And Wildlife Office

(916) 414-6600
(916) 414-6713

Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

NOT FOR CONSULTATION

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Mammals

NAME	STATUS
Salt Marsh Harvest Mouse Reithrodontomys raviventris Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/613	Endangered

Birds

NAME	STATUS
California Clapper Rail Rallus longirostris obsoletus Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/4240	Endangered
California Least Tern Sterna antillarum browni Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/8104	Endangered
Western Snowy Plover Charadrius nivosus nivosus There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/8035	Threatened

Yellow-billed Cuckoo Coccyzus americanus — Threatened
There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
https://ecos.fws.gov/ecp/species/3911

Reptiles

NAME	STATUS
Alameda Whipsnake (=striped Racer) Masticophis lateralis euryxanthus Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/5524	Threatened

Amphibians

NAME	STATUS
California Red-legged Frog Rana draytonii Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/2891	Threatened
California Tiger Salamander Ambystoma californiense There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/2076	Threatened
Foothill Yellow-legged Frog Rana boylii No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/5133	Threatened

NOT FOR CONSULTATION

Fishes

NAME	STATUS
Longfin Smelt Spirinchus thaleichthys No critical habitat has been designated for this species.	Proposed Endangered
Tidewater Goby Eucyclogobius newberryi Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/57	Endangered

Insects

NAME	STATUS
Monarch Butterfly Danaus plexippus Wherever found No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/9743	Candidate

Crustaceans

NAME	STATUS
Vernal Pool Fairy Shrimp Branchinecta lynchi Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/498	Threatened

Flowering Plants

NAME	STATUS
California Seablite Suaeda californica No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/6310	Endangered

Contra Costa Goldfields Lasthenia conjugens Wherever found	Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
https://ecos.fws.gov/ecp/species/7058

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

There are no critical habitats at this location.

You are still required to determine if your project(s) may have effects on all above listed species.

NOT FOR CONSULTATION

Bald & Golden Eagles

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act[1] and the Migratory Bird Treaty Act[2].

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats[3], should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

Additional information can be found using the following links:

- Eagle Managment https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

There are bald and/or golden eagles in your project area.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds Jan 1 to Aug 31
Golden Eagle Aquila chrysaetos This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1680	Breeds Jan 1 to Aug 31

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

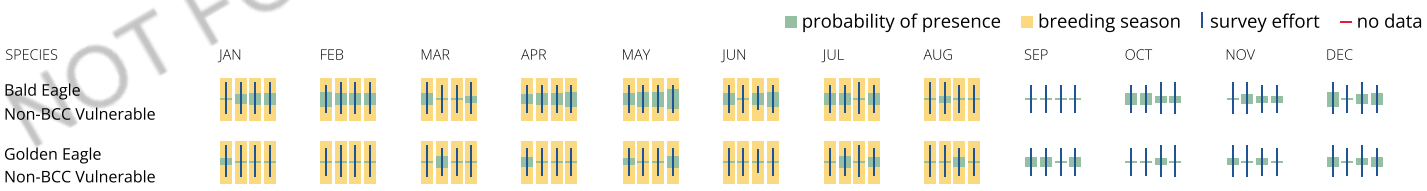
Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.



Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

NOT FOR CONSULTATION

What does IPaC use to generate the potential presence of bald and golden eagles in my specified location?

The potential for eagle presence is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply). To see a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What does IPaC use to generate the probability of presence graphs of bald and golden eagles in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur. Please contact your local Fish and Wildlife Service Field Office if you have questions.

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats[3] should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/ documents/nationwide-standard-conservation-measures.pdf
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NOT FOR CONSULTATION

NAME	BREEDING SEASON
Allen's Hummingbird Selasphorus sasin This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9637	Breeds Feb 1 to Jul 15
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds Jan 1 to Aug 31
Belding's Savannah Sparrow Passerculus sandwichensis beldingi This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/8	Breeds Apr 1 to Aug 15
Black Oystercatcher Haematopus bachmani This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9591	Breeds Apr 15 to Oct 31
Black Scoter Melanitta nigra This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds elsewhere
Black Skimmer Rynchops niger This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/5234	Breeds May 20 to Sep 15
Black Swift Cypseloides niger This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/8878	Breeds Jun 15 to Sep 10
Black Tern Chlidonias niger This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/3093	Breeds May 15 to Aug 20
Black Turnstone Arenaria melanocephala This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere
Brown Pelican Pelecanus occidentalis This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds Jan 15 to Sep 30

Bullock's Oriole Icterus bullockii — Breeds Mar 21 to Jul 25
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

California Gull Larus californicus — Breeds Mar 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

California Thrasher Toxostoma redivivum — Breeds Jan 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Cassin's Finch Carpodacus cassinii — Breeds May 15 to Jul 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9462

Clark's Grebe Aechmophorus clarkii — Breeds Jun 1 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Common Loon gavia immer — Breeds Apr 15 to Oct 31
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/4464

Common Murre Uria aalge — Breeds Apr 15 to Aug 15
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Common Yellowthroat Geothlypis trichas sinuosa — Breeds May 20 to Jul 31
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/2084

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

Lawrence's Goldfinch Carduelis lawrencei — Breeds Mar 20 to Sep 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9464

Long-tailed Duck Clangula hyemalis — Breeds elsewhere
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/7238

Marbled Godwit Limosa fedoa — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9481

Mountain Plover Charadrius montanus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3638

Nuttall's Woodpecker Picoides nuttallii — Breeds Apr 1 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9410

NOT FOR CONSULTATION

Oak Titmouse Baeolophus inornatus — Breeds Mar 15 to Jul 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9656

Olive-sided Flycatcher Contopus cooperi — Breeds May 20 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3914

Pink-footed Shearwater Puffinus creatopus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Pomarine Jaeger Stercorarius pomarinus — Breeds elsewhere
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Red Phalarope Phalaropus fulicarius — Breeds elsewhere
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Red-breasted Merganser Mergus serrator — Breeds elsewhere
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Red-necked Phalarope Phalaropus lobatus — Breeds elsewhere
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Red-throated Loon Gavia stellata — Breeds elsewhere
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Ring-billed Gull Larus delawarensis — Breeds elsewhere
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Short-billed Dowitcher Limnodromus griseus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9480

Surf Scoter Melanitta perspicillata — Breeds elsewhere
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Tricolored Blackbird Agelaius tricolor — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3910

Western Grebe aechmophorus occidentalis — Breeds Jun 1 to Aug 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/6743

White-winged Scoter Melanitta fusca — Breeds elsewhere
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

NOT FOR CONSULTATION

Willet Tringa semipalmata — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Wrentit Chamaea fasciata — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

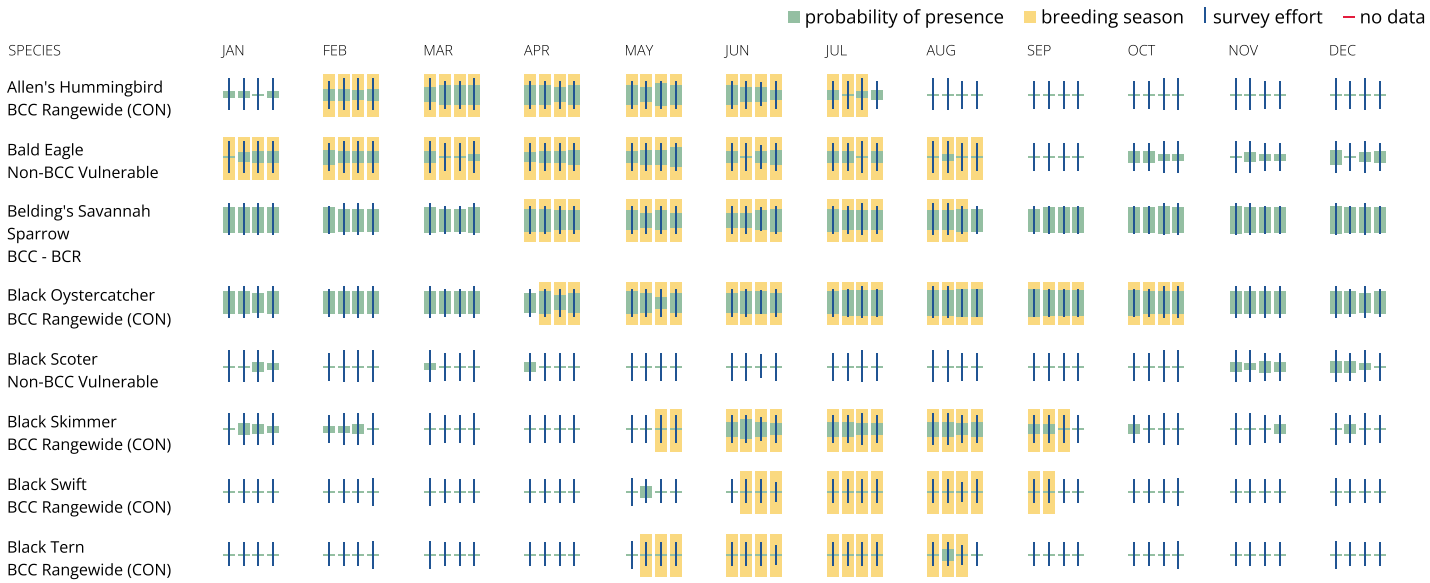
Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.



Breeding Season (■)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)

NOT FOR CONSULTATION

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the list of migratory birds that potentially occur in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets.

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may query your location using the RAIL Tool and look at the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

NOT FOR CONSULTATION

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

There are no refuge lands at this location.

Fish hatcheries

There are no fish hatcheries at this location.

NOT FOR CONSULTATION

Wetlands in the National Wetlands Inventory (NWI)

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Wetland information is not available at this time

This can happen when the National Wetlands Inventory (NWI) map service is unavailable, or for very large projects that intersect many wetland areas. Try again, or visit the NWI map to view wetlands at this location.

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to

establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

Cultural Resources Memorandum

Cultural Resources Due Diligence Level Review – New Industrial Building and Parking Structure, 880 Doolittle Drive, San Leandro, Alameda County (PLN20-0036)

TO:	Claudia Tarpin (562-376-9271) Director, Development ***Prologis***, El Segundo
RE:	Archaeological Resources Due Diligence Level Review - New Industrial Building and Parking Structure, 880 Doolittle Drive, San Leandro (PLN20-0036)
FROM:	Colin I. Busby, Project Principal (510 430-8441 ext 101)
DATE:	12 April, 2024 (Revised)

INTRODUCTION

Prologis is proposing to redevelop a 14.4 acres site comprised of two parcels at 880 Doolittle Drive/498 Hester Street, City of San Leandro (APN 077A-0741-004-02; 077A-0741-005-00; USGS San Leandro, CA, 1993 T2S, R3W) [Figs. 1-3, 17]. The project plans to demolish four existing buildings and construct a single 98,015 square-foot warehouse building with a total building area of 106,747 square feet. The proposed project would contain office and industrial uses and operate as a distribution and delivery station for a single tenant. The distribution and delivery station would receive deliveries of consumer products, sort and store these products, and coordinate the delivery of products to the customer. The project also includes surface parking spaces, landscaping, and stormwater improvements. The site is located in a mixed-use commercial and industrial area of the Davis Tract in northwestern San Leandro.

The most recent use was an Expresso Airport Parking facility and includes asphalt parking areas and an auxiliary building and three former industrial buildings repurposed for indoor parking totaling 213,500 square feet. The initial facility was developed in the mid to late 1940s by Robert Osborne Engineering that manufactured motor or aircraft parts. Kaiser Industries Corporation/Kaiser Aerospace & Electronics Corporation (KAEC) apparently took over operations in 1951 although it did not purchase the property until 1957. The project site also appears to have been occupied by the Oakland Aircraft Division of Willys Motors, Inc., San Leandro in 1955-1956/1962. Kaiser manufactured aircraft bodies and parts from 1955 to 1957 but then shifted in 1957 to manufacturing nozzles for rocket engines with limited production of aircraft parts. Portions of the property were also used for employee parking and storage. Manufacturing continued until the plant was closed in 1996. The site was used as an off-airport parking enterprise from 2002/2003 to 2018/2020.

The topography is relatively flat and is approximately 13 feet above mean sea level. San Leandro Creek is located approximately 0.5 miles north of the project site and San Francisco Bay is approximately one mile to the southwest. The project site is within Holocene alluvial fan deposits (fine facies Qhff) and latest Holocene alluvial fan deposits (see Witter et al. 2006). Subsurface sediments are primarily unconsolidated and interbedded fine sand, silt and clay

deposits in fluvial, inter-fluvial basin and alluvial environments. Ground water is found approximately 5-7 feet below the surface depending on the season.

Basin Research Associates (BASIN) was requested to review the proposed project site to determine if historic properties or unique archaeological resources would be affected by the proposed actions for use in a California Environmental Quality Act (CEQA) study.

PROJECT SITE HISTORY (excerpted from Langan 2019 and other sources)

The project site covers 14.4 acres within two parcels – 880 Doolittle Drive (southern portion) and 498 Hester Street (northern portion) – in a mixed-use commercial and industrial area of northwest San Leandro. Currently, the northern portion consists of asphalt-paved parking areas, and the southern portion is occupied by three large, industrial, warehouse-like buildings, and a smaller office or administrative building [see Fig. 3]. Project redevelopment will result in the demolition of the existing buildings. The project site was recently used as an off-site airport parking facility.

LAND USE AND DEVELOPMENT

The project site in the later 19th century was in a large open area in agriculture west of the city boundary of San Leandro [see Figs. 4-6]. Davis Street, a major east-west trending road, was in place and the alignment of Bayshore or Shoreline Boulevard (the future Doolittle Drive) extended north from Davis Street towards the Oakland city boundary. The South[ern] Pacific Railroad (SPRR) to Alameda and Oakland was present both north and south of Davis Street following the approximate and future alignment of Doolittle Drive (Thompson and West 1878:36; USGS Haywards, Calif. 1899; Shaffer 1972:128). The area to the immediate west of the present-day alignment of Doolittle Drive and the railroad was largely tidal marshland with San Leandro Creek to the north. The project site was primarily located within a 100 acre parcel owned by D. Sullivan in 1874 (see Allardt 1874) and a 33 ½ acre parcel owned by D. Tosto in 1878 (Thomson and West 1878) [Figs. 5-6].

By the early 20th century, there were orchards to the northeast and southeast of the project site but the project vicinity is shown as open agricultural fields [Fig. 7]. Several additional roads were present in the area to the south of the project site. One notable change was the addition of a rail connection to the main SPRR line heading to Oakland [Fig. 8] and the possible abandonment of the alignment to Alameda. The 1915 USGS shows the rail line as the only railroad near the project site but the original rail alignment to Alameda adjacent to and through the tidal marsh is still shown on other maps, and appears to be visible in a 1939 aerial (USGS Haywards, Calif. 1915; USCGS San Francisco Bay, Southern Part, 1905, 1923). Detailed information on the railroad and its changes is provided in Shafter (1972:37). The extent of marshland to the west and north of the project vicinity appears unchanged.

By 1939 filling had occurred on some of the tidal marsh west of Doolittle. A sewer plant is visible at the end of Davis Street, and an industrial building had been built on Davis Street, east of the SPRR tracks [see Figs. 9-10]. The Oakland Airport North Field is present having been developed in 1927. Much of the area, however, remained in agriculture and the project site was mostly vacant. The Nimitz Freeway (Interstate I-880), not visible on a 1946 aerial, is mapped on the 1947 USGS San Leandro topographic map; however, the section between 98th Avenue in

Oakland and Lewelling Boulevard in San Leandro was not completed until mid-June 1952 and the section from Lewelling to Jackson Street in Hayward was completed in 1953.

Housing developments are present west of the SPRR tracks and Doolittle Drive, approximately one mile to the south of the project site. The USGS topographic map shows three more industrial buildings in the vicinity, including the first building on the project parcel (USGS San Leandro, Calif. 1947) [Figs. 11-12]. A 1946 aerial photograph shows initial site development with grading and foundations present – a start to the post-World War II development of northwest San Leandro.

Early industry in San Leandro was clustered on the east end of Davis Street generally near the SPRR tracks before East 14th Street and/or Bancroft Avenue in the vicinity of Alvarado and Martinez streets. Industrial development in San Leandro increased during and just after WWII with a focus on calculating machines, food products, tractor parts, boxes and paper products, auto assembly and parts, aircraft assembly and parts, paint, electronic and scientific instruments, furniture and wood specialties, chemicals, process instruments and general machine and tool and die parts. The presence of the railroad, the completion of the Nimitz Freeway in the early 1950s and the Port of Oakland all facilitated transportation for raw materials and finished product shipping. The Oakland Airport, constructed in 1927 and subsequently expanded and developed by the Port of Oakland, provided passenger and cargo transport.

The late 1940s and early 1950s resulted in the development of new sewer lines and outfalls and the expansion of the sewage treatment plant site at the end of Davis Street with partial funding provided by the new Chrysler Dodge auto assembly plant on Davis Street just east of Doolittle Drive. Industrial development started in earnest from 1948 on with the annexation of more than 80 industrial properties over 20 years (see Shaffer 1972:128-129) with a focus south of Davis Street along Doolittle Drive and west of the Nimitz Freeway which was opened in the early 1950s. In 1954, there were 198 industrial firms employing 14,000 workers in San Leandro. Virtually all of the industries had entered the city within a few years due to post-WWII and Korean War industrial expansion as well as the continuing focus on agriculture and food processing industries (San Leandro Historical Society, personal communications with C. Busby, September 2021). The availability of open land, expanding and new transportation networks, the presence of a skilled post-war labor pool and the opening of large areas of the Eastbay including San Leandro and unincorporated San Lorenzo for suburban housing development were factors that fed the industrial expansion.

The 1950s industrial expansion included the project area. By 1958, scattered industrial buildings are present in the project vicinity, although there are still many undeveloped parcels in the area. There is little marshland remaining. By 1963, development is starting to fill in the area to the northwest and by 1982 the area is predominantly industrial with only a few unbuilt parcels. Small manufacturing and fabrication, transportation, storage, food processing and service based industries are dominant.

Development of industrial San Leandro continued steadily through the 1990s with minor development in early 21st century. At present, there is increasing focus on biotechnology research and development (R&D) as well as continuing emphasis on food processing, beverage production and light manufacturing and service related industries. Relocation of these industries to San Leandro appears driven by the proximity of a trained and available workforce, the

presence and availability of varied transportation networks for both raw materials and the shipping of finished goods, ample storage and warehousing, City tax and development incentives and adaptive reuse of existing industrial infrastructure.

Project Site

The project site follows the industrial development trends of northwest and other areas of San Leandro transitioning from initial manufacturing to both light manufacturing and serviced based uses in later years. In 1939 the project site was undeveloped agricultural land and vacant as was the surrounding area. By 1946 initial site development had started. A 1946 aerial photograph shows the initial site development with a building present along the 880 Doolittle parcel north edge and grading and/or new building foundations within the main portion of the parcel. A distinct "L" shaped building or building foundation is present that probably represents the initial configuration of the administrative building near the entrance from Doolittle Drive. The 498 Hester parcel was vacant and undeveloped.

Initial use in the late 1940s included the manufacture of motor or aircraft parts possibly for use by the other industries clustered around the Oakland Airport or for use in the auto assembly plants in San Leandro (Chrysler Dodge), Oakland (GMC) or Milpitas (Ford). Kaiser Industries Corporation/Kaiser Aerospace & Electronics Corporation (KAEC) apparently took over operations in 1951 although it did not purchase the property until 1957. The project site also appears to have been occupied by the Oakland Aircraft Division of Willys Motors, Inc., San Leandro in 1955-1956/1962. KAEC manufactured aircraft bodies and parts from 1955 to 1957 but then shifted in 1957 to manufacturing nozzles for rocket engines with limited production of aircraft parts. Portions of the property were also used for employee parking and storage. Manufacturing continued until the plant was closed in 1996. The site was used as an off-airport parking enterprise from 2002/2003 to 2018/2020.

By 1958, the 498 Hester Street property had one building and had been recently paved. The property was used for employee parking and storage associated with the adjacent 880 Doolittle property from 1963 until 1976. After 1976, KAEC leased 75% of the 498 Hester Street property to other businesses including a truck trailer repair and storage company and light manufacturing company. From 1995 to October 2002, the property was used by a cargo container repair and storage company. The parcel is currently vacant and is completely paved.

In terms of the built environment, there are multiple buildings on the 880 Doolittle Drive parcel [see Figs. 17-25]. The Administration Building was constructed first around 1946 and is freestanding, just off Doolittle Drive at the western portion of the parcel. The Northern Building, based on historic aerial photographs and maps, appears to have been built in 1946-47 with an addition constructed at its west side in 1961. The Southern Building and adjacent Breezeway Building were both built in 1964, with an addition to the east side of the Southern Building constructed in 1966. These industrial buildings were merged and connected through several building campaigns forming continuous, irregular roof coverage over a large portion of the parcel (see *Historical Resource Evaluation 880 Doolittle drive & 498 Hester Street [Parcels 077A-0741-004002 & 077A-0741-004-00, San Leandro, CA* [architecture + history, llc 2024]).

RESEARCH PROTOCOLS

A prehistoric and historic site records and literature search for a 0.25 mile radius from the project site was completed by the California Historical Resources Information System, Northwest Information Center, Sonoma State University (CHRIS/NWIC File No. 20-1048 by Hagel, dated 12/8/20). Reference material from the Bancroft Library at the University of California, Berkeley, Basin Research Associates, San Leandro and available on the web was also consulted. Sources included:

National Register of Historic Places listings for Alameda County, California (USNPS 2017-2020);

OHP Built Environment Resources Directory [BERD] (CAL/OHP 2020a).

Listed California Historical Resources (CAL/OHP 2020b) with the most recent updates of the National Register of Historic Places; California Historical Landmarks; and, California Points of Historical Interest as well as other evaluations of properties reviewed by the State of California Office of Historic Preservation;

California History Plan (CAL/OHP 1973);

California Inventory of Historic Resources (CAL/OHP 1976);

Five Views: An Ethnic Sites Survey for California (CAL/OHP 1988);

Archaeological Determinations of Eligibility (CAL/OHP 2020c);

Other regional/local lists and maps (see preceding Land Use History Section and References Cited and Consulted).

The Native American Heritage Commission (NAHC) was contacted for a review of the Sacred Lands Inventory (SLF) (Busby 2020a) (see Attachments). No other agencies, departments or local historical societies were contacted regarding landmarks, potential historic sites or structures.

An archaeological and built environment review of the project site was conducted by Dr. Colin I. Busby (RPA), an archaeologist meeting the Standards of the Secretary of the Interior, on December 14, 2020.

FINDINGS

No prehistoric, combined prehistoric/historic era, and/or historic era archaeological sites have been recorded within the project site. The *OHP Built Environment Resources Directory* [BERD] (CAL/OHP 2020a) has no resources listed for the project addresses.

RECORDS SEARCH RESULTS

The San Leandro Fiber Optic for Broadband project (excluding California Office of Historic Preservation correspondence) has four reports with negative results within or adjacent to the project site. Twelve additional cultural resources studies are within 0.25 mile of the project site with generally negative results (see Table 1).

No prehistoric, combined prehistoric/historic era, and/or historic era archaeological sites have been recorded within the project site. Two historic buildings and one historic district are within 1000 feet (see Table 2). Two resources have been found ineligible for the National Register of Historic Places (NR), the California Register of Historical Resources (CR) or Local Listing (LL) through survey evaluation. One resource, the Davis West Historic District, has been determined ineligible for the NR by consensus through Section 106 process – not evaluated for CR or LL.

FIELD REVIEW [see Figs. 4-12]

Dr. Colin I. Busby (RPA) completed an archaeological and built environment field review of the project site on December 14, 2020. The 14-acre project site is generally paved with three large size industrial buildings and an associated administrative office present. The buildings were secured and not inspected from the interior. Langan (2019) provides a number of interior building views and these were reviewed.

No surface evidence of prehistoric or historic cultural material was observed as entire area was covered with hardscape and native soil was not available for inspection.

INDIVIDUALS, GROUP AND AGENCY PARTICIPATION

The Native American Heritage Commission (NAHC) was contacted for a review of the Sacred Lands Inventory (SLF) (Busby 2020a). The NAHC responded indicating the review of the SLF was negative and providing a list of 10 Native American tribes and individuals for consultation pursuant to Assembly Bill (AB 52) (Fonseca 2020) (see Attachments). Consultation requires government to government contact and the City of San Leandro will undertake AB 52 consultation when the City has determined that the application for the project is complete. BASIN did not complete any outreach to the Native American tribes and individuals due to the City's mandate to complete AB 52 outreach.

No other agencies were contacted. However, contract was made with Ms. Cynthia Simons, President, San Leandro Historical Society, who reviewed her files on "industry" in northwest San Leandro. She provided several undated newspaper articles and advertisements concerning Kaiser Aerospace and Electronics Corporation. One articles had information regarding an award made to the firm for "Zero Defects" for machined parts provided to the United States Air Force and the other was a help wanted advertisement for machinists, heliarc welders and maintenance mechanics.

SUMMARY

- The CHRIS/NWIC records review found no record of previous cultural resources studies for the project site and did not note the presence of any prehistoric and/or historic era archaeological sites within or adjacent to the project site.
- No Native American villages, traditional use areas or contemporary use areas or other features of significance have been identified in or adjacent to the project site.
- No Hispanic era features have been identified in or adjacent to the project site.
- No American Period archaeological sites have been recorded, reported or identified in or adjacent to the project site.
- No surface evidence of prehistoric or historic cultural material was observed as entire area was covered with hardscape.
- The built environment was reviewed by architecture + history, llc (2024) who determined that the buildings do not appear to qualify as Historical Resources under CEQA. They do not appear to be associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage (Criterion 1) nor are they associated with the lives of persons important in our past (Criterion 2). None of the buildings embody the distinctive characteristics of a type, period, region, or method of construction, or represent the work of an important creative individual, or possesses high artistic values (Criterion 3). None of the buildings meet the City of San Leandro's criteria for a City Landmark or designation as a Merit Resource.
- Research completed for the project suggests a low potential for the presence of subsurface prehistoric and/or historic deposits either within or adjacent to the project site. The nearest known prehistoric resources are located along San Leandro Creek 0.5 mile to north. No prehistoric uses have been exposed in the general area.

- No listed or known potential National Register of Historic Places and/or California Register of Historical Resources are located in or adjacent to the project site. No other significant or potentially significant local, state or federal cultural resources/historic properties, landmarks, points of interest, etc. have been identified in or immediately adjacent to the project site.

MANAGEMENT RECOMMENDATIONS

It is the considered opinion of BASIN, based on a review of pertinent records, maps and other documents and a field inventory, that the proposed project can proceed as planned in regard to prehistoric and historic archaeological resources. No subsurface testing for buried archaeological resources appears warranted. The built environment does not appear to be eligible for listing on the California Register of Historic Resources or as a City of San Leandro Historic Resource (see architecture + history, llc 2024).

BASIN recommends that if any unanticipated prehistoric or historic period cultural materials[1] are exposed during construction grading and/or excavation, operations should stop within 50 feet of the find and a qualified professional archaeologist contacted for evaluation and further recommendations consistent with CEQA and City of San Leandro requirements. Potential recommendations could include evaluation, collection, recordation, analysis, etc. of any significant cultural materials followed by a professional report.

---

1. Significant prehistoric cultural resources are defined as human burials, features or other clusterings of finds made, modified or used by Native American peoples in the past. The prehistoric and protohistoric indicators of prior cultural occupation by Native Americans include artifacts and human bone, as well as soil discoloration, shell, animal bone, sandstone cobbles, ashy areas, and baked or vitrified clays. Prehistoric materials may include:

   a. Human bone - either isolated or intact burials.
   b. Habitation (occupation or ceremonial structures as interpreted from rock rings/features, distinct ground depressions, differences in compaction (e.g., house floors).
   c . Artifacts including chipped stone objects such as projectile points and bifaces; groundstone artifacts such as manos, metates, mortars, pestles, grinding stones, pitted hammerstones; and, shell and bone artifacts including ornaments and beads.
   d. Various features and samples including hearths (fire-cracked rock; baked and vitrified clay), artifact caches, faunal and shellfish remains (which permit dietary reconstruction), distinctive changes in soil stratigraphy indicative of prehistoric activities.
   e. Isolated artifacts

   Historic cultural materials may include finds from the late 19th through early 20th centuries. Objects and features associated with the Historic Period can include.

   a. Structural remains or portions of foundations (bricks, cobbles/boulders, stacked field stone, postholes, etc.).
   b. Trash pits, privies, wells and associated artifacts.
   c. Isolated artifacts or isolated clusters of manufactured artifacts (e.g., glass bottles, metal cans, manufactured wood items, etc.).
   d. Human remains.

   In addition, cultural materials including both artifacts and structures that can be attributed to Hispanic, Asian and other ethnic or racial groups are potentially significant. Such features or clusters of artifacts and samples include remains of structures, trash pits, and privies.

State law shall be followed in regard to Native American burials (Chapter 1492, Section 7050.5 to the Health and Safety Code, Sections 5097.94, 5097.98 and 5097.99 of the Public Resources Code).

Project Description:

Prologis is proposing to develop a new 250,000 square foot industrial building and parking structure for the operation of a last mile delivery distribution center at 880 Doolittle Drive, City of San Leandro (APN 077A-0741-004-02; 077A-0741-005-00; USGS San Leandro, CA, 1993 T2S, R3W).

The project site, covering 13.72 acres on two parcels (880 Doolittle/498 Hester Street), is located within a portion of the former Expresso Airport Parking facility and includes an auxiliary building, an asphalt parking lot and former industrial buildings repurposed for indoor parking. The facility was the former location of Kaiser Industries Corporation/Kaiser Aerospace & Electronics Corporation from 1957-2001. During that time, Kaiser manufactured aircraft bodies and parts and rocket nozzles on the property and used portions of the property for employee parking and storage. The project site was occupied by the Oakland Aircraft Division of Willys Motors, Inc., San Leandro in 1955-1956.

The City of San Leandro will use the information to develop an IS/MND under the California Environmental Quality Act.

Re: Native American Tribal Consultation, Pursuant to the Assembly Bill 52 (AB 52), Amendments to the California Environmental Quality Act (CEQA) (Chapter 532, Statutes of 2014), Public Resources Code Sections 5097.94 (m), 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2 and 21084.3, 880 Doolittle Drive Industrial Building, San Leandro Project, Alameda County

To Dr. Busby:

Pursuant to Public Resources Code section 21080.3.1 (c), attached is a consultation list of tribes that are traditionally and culturally affiliated with the geographic area of the above-listed project. Please note that the intent of the AB 52 amendments to CEQA is to avoid and/or mitigate impacts to tribal cultural resources, (Pub. Resources Code §21084.3 (a)) ("Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource.")

Public Resources Code sections 21080.3.1 and 21084.3(c) require CEQA lead agencies to consult with California Native American tribes that have requested notice from such agencies of proposed projects in the geographic area that are traditionally and culturally affiliated with the tribes on projects for which a Notice of Preparation or Notice of Negative Declaration or Mitigated Negative Declaration has been filed on or after July 1, 2015. Specifically, Public Resources Code section 21080.3.1 (d) provides:

Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section.

The AB 52 amendments to CEQA law does not preclude initiating consultation with the tribes that are culturally and traditionally affiliated within your jurisdiction prior to receiving requests for notification of projects in the tribe's areas of traditional and cultural affiliation. The Native American Heritage Commission (NAHC) recommends, but does not require, early consultation as a best practice to ensure that lead agencies receive sufficient information about cultural resources in a project area to avoid damaging effects to tribal cultural resources.

The NAHC also recommends, but does not require that agencies should also include with their notification letters, information regarding any cultural resources assessment that has been completed on the area of potential effect (APE), such as:

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:

- A listing of any and all known cultural resources that have already been recorded on or adjacent to the APE, such as known archaeological sites;
- Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
- Whether the records search indicates a low, moderate, or high probability that unrecorded cultural resources are located in the APE; and
- If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.

2. The results of any archaeological inventory survey that was conducted, including:

   - Any report that may contain site forms, site significance, and suggested mitigation measures.

     All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for public disclosure in accordance with Government Code section 6254.10.

3. The result of any Sacred Lands File (SLF) check conducted through the Native American Heritage Commission was negative.

4. Any ethnographic studies conducted for any area including all or part of the APE; and

5. Any geotechnical reports regarding all or part of the APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS are not exhaustive and a negative response to these searches does not preclude the existence of a tribal cultural resource. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the event that they do, having the information beforehand will help to facilitate the consultation process.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our consultation list remains current.

If you have any questions, please contact me at my email address: Sarah.Fonseca@nahc.ac.gov.

Sincerely,

Sarah Fonseca
Cultural Resources Analyst

Please forward a copy of any resulting reports from this project to the office as soon as possible. Due to the sensitive nature of archaeological site location data, we ask that you do not include resource location maps and resource location descriptions in your report if the report is for public distribution. If you have any questions regarding the results presented herein, please contact the office at the phone number listed above.

The provision of CHRIS Data via this records search response does not in any way constitute public disclosure of records otherwise exempt from disclosure under the California Public Records Act or any other law, including, but not limited to, records related to archeological site information maintained by or on behalf of, or in the possession of, the State of California, Department of Parks and Recreation, State Historic Preservation Officer, Office of Historic Preservation, or the State Historical Resources Commission.

Due to processing delays and other factors, not all of the historical resource reports and resource records that have been submitted to the Office of Historic Preservation are available via this records search. Additional information may be available through the federal, state, and local agencies that produced or paid for historical resource management work in the search area. Additionally, Native American tribes have historical resource information not in the CHRIS Inventory, and you should contact the California Native American Heritage Commission for information on local/regional tribal contacts.

Should you require any additional information for the above referenced project, reference the record search number listed above when making inquiries. Requests made after initial invoicing will result in the preparation of a separate invoice.

Thank you for using the California Historical Resources Information System (CHRIS).

Sincerely,

Lisa C. Hagel
Researcher

Type of Services	**Geotechnical Investigation**
Project Name	**Doolittle Drive Warehouse**
Location	**880 Doolittle Drive** **San Leandro, California**

SECTION 1: INTRODUCTION

This geotechnical report was prepared for the sole use of PROLOGIS for the Doolittle Drive Warehouse project in San Leandro, California. The location of the site is shown on the Vicinity Map, Figure 1. For our use, we were provided with the following documents:

- A site plan titled "DCK5, San Leandro, Concept 4 Site Plan," Sheet CS104, prepared by Langan Engineering, dated August 7, 2020.
- A topographic survey titled "Topographic Survey of 880 Doolittle Dr, San Leandro, CA," prepared by Kimley Horn, dated July 13, 2020.
- An environmental remediation report titled "Remedial Design and Implementation Plan, Former Kaiser Aerotech Facilities, 880 Doolittle Drive and 498 Hester Street, San Leandro, California, 01-KAEC-001," prepared by SGI Environmental, dated April 28, 2008.
- A groundwater monitoring report titled "2017 Annual Groundwater Monitoring Report, Former Kaiser Aerotech Facilities, 880 Doolittle Drive and 498 Hester Street, San Leandro, California, 01-OPEX-001," prepared by SGI Environmental, dated May 15, 2017.

1.1 PROJECT DESCRIPTION

The project will include redeveloping the approximately 16-acre site for a new commercial warehouse/distribution facility. The new building will be approximately 95,000 square feet with about 86,800 square feet of warehouse space and about 8,200 square feet of office space located on the north and south ends of the building. The new building will have interior clear height of about 32 feet and concrete tilt-up construction. Truck loading docks will be located along the north side of the building, van loading zones will be on the east side of the building, about 127,450 square feet of associate parking will be on the west side of the building, and about 210,890 square feet of van parking will be on the east and south sides of the building.

Appurtenant utilities, landscaping, stormwater management areas, and other improvements necessary for the overall site development are also planned.

Building loads have not been provided at this time, however are expected to be typical of this type of construction. Based on conversations with you, the finished floor elevation will likely be at Elevation 16 to 17 feet (NAVD88 datum) and the finished floor will be generally at the same elevation across the entire building width and length. The finished grade at the truck loading dock on the north side of the building will be about 4 feet below the building finished floor and therefore anticipated at about Elevation 12 to 13 feet. Finished grades around the west, south, and east sides of the building are to be at the approximate building finished floor elevation.

Based on the current site grades, to achieve the referenced finished floor elevation, the current site grades will be at approximate finished floor elevation or will need to be raised roughly 1 to 2 feet at the north end of the building. Current site grades will need to be raised roughly 3 to 4 feet in the middle portion and 4 to 5 feet at the south end of the building to achieve finished floor elevation. Cuts on the order of 3 to 5 feet are anticipated to achieve finished grade at the loading dock along the north side of the building.

1.2 SCOPE OF SERVICES

Our scope of services was presented in our proposal dated October 9, 2019 and consisted of field and laboratory programs to evaluate physical and engineering properties of the subsurface soils, engineering analysis to prepare recommendations for site work and grading, building foundations, flatwork, retaining walls, and pavements, and preparation of this report. Brief descriptions of our exploration and laboratory programs are presented below.

1.3 EXPLORATION PROGRAM

Field exploration consisted of 12 borings drilled on June 1 to 5, 2020 with truck-mounted, hollow-stem auger drilling equipment and 10 Cone Penetration Tests (CPTs) advanced on May 18 to 20, 2020. The borings were drilled to depths of 7 to 35 feet; the CPTs were advanced to depths of 50 to 140 feet. Seismic shear wave velocity measurements were collected from CPT-1 and CPT-10. Borings EB-1, EB-2, EB-3, EB-5, EB-6, EB-7, EB-8, EB-9 and EB-12 were advanced adjacent to CPT-1, CPT-2, CPT-3, CPT-5, CPT-6, CPT-7, CPT-9, CPT-10, and CPT-8, respectively, for direct evaluation of physical samples to correlated soil behavior. Boring EB-4 was also performed in proximity to CPT-4, however slightly offset.

The borings and CPTs were backfilled with cement grout in accordance with local requirements; exploration permits were obtained as required by local jurisdictions. Environmental impacts are present at the site. Drilling procedures outlined on the drilling permit and discussed with SGI Environmental including exploration locations and depths were followed. CPT rods were cleaned with Liquinox and boring augers were steam cleaned between each exploration to reduce the potential for cross contamination.

The approximate locations of our exploratory borings are shown on the Site Plan, Figure 2. Details regarding our field program are included in Appendix A.

1.4 LABORATORY TESTING PROGRAM

In addition to visual classification of samples, the laboratory program focused on obtaining data for foundation design and seismic ground deformation estimates. Testing included moisture contents, dry densities, Plasticity Index tests, washed sieve analyses, consolidation tests, and triaxial compression tests. Details regarding our laboratory program are included in Appendix B.

1.5 ENVIRONMENTAL SERVICES

Environmental services, including a Phase I or II were not requested for this project. Environmental concerns are present at the site. The project environmental consultant should review our geotechnical recommendations for compatibility with the environmental concerns.

SECTION 2: REGIONAL SETTING

2.1 REGIONAL SEISMICITY

The San Francisco Bay area region is one of the most seismically active areas in the Country. While seismologists cannot predict earthquake events, geologists from the U.S. Geological Survey have recently updated earlier estimates from their 2015 Uniform California Earthquake Rupture Forecast (Version 3) publication. The estimated probability of one or more magnitude 6.7 earthquakes (the size of the destructive 1994 Northridge earthquake) expected to occur somewhere in the San Francisco Bay Area has been revised (increased) to 72 percent for the period 2014 to 2043 (Aagaard et al., 2016). The faults in the region with the highest estimated probability of generating damaging earthquakes between 2014 and 2043 are the Hayward (33%), Rodgers Creek (33%), Calaveras (26%), and San Andreas Faults (22%). In this 30-year period, the probability of an earthquake of magnitude 6.7 or larger occurring is 22 percent along the San Andreas Fault and 33 percent for the Hayward or Rodgers Creek Faults.

The faults considered capable of generating significant earthquakes are generally associated with the well-defined areas of crustal movement, which trend northwesterly. The table below presents the State-considered active faults within 25 kilometers of the site.

Table 1: Approximate Fault Distances

Fault Name	Distance	
	(miles)	(kilometers)
Hayward (Total Length)	2.8	4.5
Calaveras	11.5	18.5
San Andreas (1906)	15.5	25.0

A regional fault map is presented as Figure 3, illustrating the relative distances of the site to significant fault zones.

SECTION 3: SITE CONDITIONS

3.1 SURFACE DESCRIPTION

The irregularly shaped site is located at the southern end of the Hester Street cul-de-sac and is generally surrounded by and located in an area of industrial/commercial buildings with associated parking lots and equipment yards. Railroad tracks are located directly to the west and south of the site with the adjacent buildings beyond. A storage yard with construction equipment and materials is located outside the southeast portion of the site with Carden Street and adjacent buildings beyond. Large electrical towers also run generally north-south within the storage yard. Industrial/commercial buildings and associated parking lots/equipment yards are located adjacent to the northwest, north, and northeast sides of the site. The main driveway entrance into the site is from Doolittle Drive near the southwest corner of the site. The site is generally enclosed by chain-link fencing, wrought-iron fencing, and construction fencing.

The majority of the southern half of the site is currently occupied by a large interconnected one- and two-story industrial/commercial/warehouse/office type building. Portions of the building are two-stories while other connected portions are a high-bay industrial/warehouse building. Another smaller one-story building is located in the western/southwestern portion of the site. The northern half of the site is generally an asphalt concrete parking lot. Asphalt concrete parking and driving areas are also located on the eastern and the western sides of the buildings where the irregular shaped site extends westward. Some areas of Portland cement concrete (PCC) pavements/slabs are also present generally on the eastern side of the large building. Light poles are positioned throughout the parking lots and high voltage power poles run in east-west direction across the site. The site is relatively level and slopes slightly upward to the north/northeast. Existing site grades are approximately Elevation 10 to 12 feet (NAVD88 datum) along the western/southwestern side of the site, 12 to 14 feet in the southeastern corner of the site, and 15 to 17 feet in the north/northeast portion of the site.

Surface pavements at our boring locations generally consisted of 3 to 4 inches of asphalt concrete over 3 to 12 inches of aggregate base. Stabilization fabric was also encountered beneath the aggregate base at Boring EB-1. Based on visual observations, the existing pavements are in generally poor to very poor condition.

3.2 SUBSURFACE CONDITIONS

Below the surface pavements, our Borings EB-3 to EB-8 and EB-11 encountered undocumented fills to depths ranging from about 1¾ to 7 feet beneath the surface. The fills consisted of medium dense to very dense clayey sand with gravel, loose silty sand with variable amounts of gravel, and stiff to very stiff sandy lean clay. Beneath the undocumented fills (except at Boring EB-8) and the surface pavements at our Borings EB-1, EB-2, EB-9, EB-10, and EB-12, an approximately 1½ to 3 foot layer of medium stiff to very stiff highly expansive clay was encountered to depths ranging from 3 to 7 feet beneath the surface. Beneath the highly expansive clay and the undocumented fills at Boring EB-8, generally stiff to very stiff lean clays with variable amounts of sand were encountered to the maximum depth explored in our borings of 35 feet beneath the surface. At some borings, the lean clays were also observed to have

lower strength and be medium stiff at depths ranging from about 7 to 12 feet and 15 to 25 feet. Beneath the highly expansive clays at Boring EB-1 and EB-9, an approximate 1-foot layer of medium dense clayey sand was encountered above the lean clays. Some 1- to 3-foot thick loose to medium dense clayey sand, silty, clayey sand, and poorly graded sand with silt layers were observed interbedded within the lean clays at various depths.

Beneath the depth of our borings, our CPTs generally interpreted stiff to very stiff clays and silts interbedded with generally thin (less than 2 feet thick) layers of sands to the maximum depths explored ranging from about 50 to 140 feet beneath the surface. A thicker sand layer was encountered within CPT-3 and CPT-5 to CPT-8 at depths ranging from about 38 to 46 feet and a depth of about 52 to 62 feet in CPT-3.

3.2.1 Plasticity/Expansion Potential

We performed five Plasticity Index (PI) tests on representative samples. Test results were used to evaluate the expansion potential of surficial soils and the plasticity of the fines in potentially liquefiable layers. The near surface PI test resulted in a PI of 33, indicating high expansion potential to wetting and drying cycles. Results of the PI tests in potentially liquefiable soils indicated PIs of 5, 10, 16, and 23.

3.2.2 In-Situ Moisture Contents

Laboratory testing indicated that the in-situ moisture contents within the upper 10 feet range from near optimum to about 20 to 25 percent over the estimated laboratory optimum moisture.

3.3 GROUNDWATER

Groundwater was encountered in our Borings EB-1, EB-2, EB-4, EB-5, EB-7, EB-8, EB-9, EB-10, and EB-11 at depths ranging from 5 to 14 feet below current grades corresponding to Elevations of -3¼ to 9½ feet (NAVD88 datum) based on the topographic survey provided by Kimley Horn. Groundwater was not encountered to the maximum depths explored of 7 to 10 feet at Borings EB-3, EB-6, and EB-12. Groundwater was inferred at depths of approximately 2 to 7 feet below current grades in our CPT explorations based on pore pressure dissipation tests. All measurements were taken at the time of drilling and may not represent the stabilized levels that can be higher than the initial levels encountered.

Historic high groundwater levels are mapped at a depth of approximately 5 feet (CGS, San Leandro Quadrangle, Seismic Hazard Zone Report 078, 2003). Based on our review of the remediation and groundwater monitoring reports by SGI Environmental in 2008 and 2017, groundwater was noted within the report language to be generally at depths of about 5 to 7 feet beneath the surface. Based on the monitoring data also provided within the reports, groundwater appears to have been observed as shallow as about 3 feet beneath site grades.

In general, fluctuations in groundwater levels occur due to many factors including seasonal fluctuation, underground drainage patterns, regional fluctuations, and other factors. Based on

the above data and engineering judgement, we recommend a design groundwater depth of 5 feet beneath existing grades.

SECTION 4: GEOLOGIC HAZARDS

4.1 FAULT RUPTURE

As discussed above, several significant faults are located within 25 kilometers of the site. The site is not located within a State-designated Alquist Priolo Earthquake Fault Zone. As shown in Figure 3, no known surface expression of fault traces is thought to cross the site; therefore, fault rupture hazard is not a significant geologic hazard at the site.

4.2 ESTIMATED GROUND SHAKING

Moderate to severe (design-level) earthquakes can cause strong ground shaking, which is the case for most sites within the Bay Area. A peak ground acceleration (PGA_M) was estimated following the ground motion hazard analysis procedure presented in Chapter 21, Section 21.2 of ASCE 7-16 and Supplement No. 1 and determined in accordance with Section 21.5 of ASCE 7-16. For our analyses we used a PGA_M of 0.89g.

4.3 LIQUEFACTION POTENTIAL

The site is within a State-designated Liquefaction Hazard Zone (CGS, San Leandro Quadrangle, 2003). Our field and laboratory programs addressed this issue by testing and sampling potentially liquefiable layers to depths of at least 50 feet, performing visual classification on sampled materials, evaluating CPT data, and performing various tests to further classify soil properties.

4.3.1 Background

During strong seismic shaking, cyclically induced stresses can cause increased pore pressures within the soil matrix that can result in liquefaction triggering, soil softening due to shear stress loss, potentially significant ground deformation due to settlement within sandy liquefiable layers as pore pressures dissipate, and/or flow failures in sloping ground or where open faces are present (lateral spreading) (NCEER 1998). Limited field and laboratory data is available regarding ground deformation due to settlement; however, in clean sand layers settlement on the order of 2 to 4 percent of the liquefied layer thickness can occur. Soils most susceptible to liquefaction are loose, non-cohesive soils that are saturated and are bedded with poor drainage, such as sand and silt layers bedded with a cohesive cap.

4.3.2 Analysis

As discussed in the “Subsurface” section above, several sand layers were encountered below the design groundwater depth of 5 feet. Following the liquefaction analysis framework in the 2008 monograph, *Soil Liquefaction During Earthquakes* (Idriss and Boulanger, 2008), incorporating updates in *CPT and SPT Based Liquefaction Triggering Procedures* (Boulanger

and Idriss, 2014), and in accordance with CDMG Special Publication 117A guidelines (CDMG, 2008) for quantitative analysis, these layers were analyzed for liquefaction triggering and potential post-liquefaction settlement. These methods compare the ratio of the estimated cyclic shaking (Cyclic Stress Ratio - CSR) to the soil's estimated resistance to cyclic shaking (Cyclic Resistance Ratio - CRR), providing a factor of safety against liquefaction triggering. Factors of safety less than or equal to 1.3 are considered to be potentially liquefiable and capable of post-liquefaction re-consolidation (i.e. settlement).

The CSR for each layer quantifies the stresses anticipated to be generated due to a design-level seismic event, is based on the peak horizontal acceleration generated at the ground surface discussed in the "Estimated Ground Shaking" section above, and is corrected for overburden and stress reduction factors as discussed in the procedure developed by Seed and Idriss (1971) and updated in the 2008 Idriss and Boulanger monograph.

For the CPT liquefaction analysis, the soil's CRR is estimated from the in-situ measurements from the CPTs and laboratory testing on samples retrieved from our boring. The tip pressures are corrected for effective overburden stresses, taking into consideration both the groundwater level at the time of exploration and the design groundwater level, and stress reduction versus depth factors. The CPT method utilizes the soil behavior type index (I_C) to estimate the plasticity of the layers. Soil samples were collected from the borings that were in proximity to the CPTs to visually observe for confirmation of CPT soil behavior types.

For the boring liquefaction analysis, the soil's CRR is estimated from the in-situ density and strength obtained from field SPT blow counts ("N" value). The "N" values are corrected for effective overburden stresses, taking into consideration both the groundwater level at the time of exploration and the design groundwater level, and stress reduction versus depth factors. The "N" values are also corrected for fines content, hammer efficiency, boring diameter, rod length, and sampler type (with or without liners).

The results of our CPT analyses (CPT-1 to CPT-10) are presented on Figures 4A to 4J of this report. Calculations for these CPTs are attached as Appendix C. As mentioned, Boring EB-4 was performed slightly offset from the adjacent CPT-4. A poorly graded sand with silt layer was encountered that was not observed in CPT-4 at a depth of about 25 to 28 feet. As such, we performed liquefaction analysis on this sand layer observed within Boring EB-4. Calculations for Boring EB-4 are attached in Appendix C.

4.3.3 Summary

Our analyses indicate that several layers could potentially experience liquefaction triggering that could result in post-liquefaction total settlement at the ground surface ranging from less than ¼ inch up to 1 inch based on the Yoshimine (2006) method. Our analyses show that locations within the currently proposed building footprint and in close proximity to the proposed building (CPT-3, CPT-4, CPT-5, CPT-6, CPT-7, CPT-8, and CPT-10) could experience total post-liquefaction settlement of up to about ½ inch. As discussed in SP 117A, differential movement for level ground sites over deep soil sites will be up to about two-thirds of the total settlement between independent foundation elements. In our opinion, differential settlements are

anticipated to be on the order of ⅓-inch between independent foundation elements, based on the current proposed building layout.

4.3.4 Ground Rupture Potential

The methods used to estimate liquefaction settlements assume that there is a sufficient cap of non-liquefiable material to prevent ground rupture or sand boils. For ground rupture to occur, the pore water pressure within the liquefiable soil layer will need to be great enough to break through the overlying non-liquefiable layer, which could cause significant ground deformation and settlement. The work of Youd and Garris (1995) indicates that the non-liquefiable cap at all locations except for CPT-9/EB-8 is sufficient to prevent ground rupture; therefore, the above total settlement estimates at locations other than CPT-9/EB-8 are reasonable.

The location of CPT-9/EB-8 is beyond the limits of the proposed building area. As such, ground rupture at this location would not affect the proposed building in its current planned location. However, if desired to protect site improvements within this location, we recommend the undocumented fills at CPT-9/EB-8 to a depth of about 7 feet be removed and replaced as engineered fill.

4.4 LATERAL SPREADING

Lateral spreading is horizontal/lateral ground movement of relatively flat-lying soil deposits towards a free face such as an excavation, channel, or open body of water; typically lateral spreading is associated with liquefaction of one or more subsurface layers near the bottom of the exposed slope. As failure tends to propagate as block failures, it is difficult to analyze and estimate where the first tension crack will form.

There are no open faces within a distance considered susceptible to lateral spreading; therefore, in our opinion, the potential for lateral spreading to affect the site is low.

4.5 SEISMIC SETTLEMENT/UNSATURATED SAND SHAKING

Loose to medium dense unsaturated sandy soils can settle during strong seismic shaking. We evaluated the potential for seismic compaction of the unsaturated soils above the design groundwater depths based on the work by Robertson and Shao (2010). Based on our analysis, the unsaturated granular soils above the design groundwater depth could experience up to about ¼ inch of total settlement following strong seismic shaking.

This settlement is generally associated with the surficial undocumented fills. As to be discussed, we recommend the undocumented fills be reworked and recompacted as engineered fill with the building area. As such, the potential for significant differential seismic settlement affecting the proposed building will be low.

4.6 TSUNAMI/SEICHE

The terms tsunami or seiche are described as ocean waves or similar waves usually created by undersea fault movement or by a coastal or submerged landslide. Tsunamis may be generated at great distance from shore (far field events) or nearby (near field events). Waves are formed, as the displaced water moves to regain equilibrium, and radiates across the open water, similar to ripples from a rock being thrown into a pond. When the waveform reaches the coastline, it quickly raises the water level, with water velocities as high as 15 to 20 knots. The water mass, as well as vessels, vehicles, or other objects in its path create tremendous forces as they impact coastal structures.

Tsunamis have affected the coastline along the Pacific Northwest during historic times. The Fort Point tide gauge in San Francisco recorded approximately 21 tsunamis between 1854 and 1964. The 1964 Alaska earthquake generated a recorded wave height of 7.4 feet and drowned eleven people in Crescent City, California. For the case of a far-field event, the Bay area would have hours of warning; for a near field event, there may be only a few minutes of warning, if any.

A tsunami or seiche originating in the Pacific Ocean would lose much of its energy passing through San Francisco Bay. Based on the study of tsunami inundation potential for the San Francisco Bay Area (Ritter and Dupre, 1972), areas most likely to be inundated are marshlands, tidal flats, and former bay margin lands that are now artificially filled, but are still at or below sea level, and are generally within 1½ miles of the shoreline. The site is approximately ¾ miles inland from the San Francisco Bay shoreline, and the existing elevations are approximately at Elevation 11 to 17 feet (NAVD88 datum) according to the topographic survey provided by Kimley Horn. Additionally, the site is mapped by the State of California Tsunami Inundation Map as not being within an inundation area. Therefore, the potential for inundation due to tsunami or seiche is considered low.

4.7 FLOODING

Based on our internet search of the Federal Emergency Management Agency (FEMA) flood map public database, the majority of the site is located within Zone X, described as "area of minimal flood hazard." The western portion of the site is located within Zone X, described as an area with "0.2% annual chance flood hazard, areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile." We recommend the project civil engineer be retained to confirm this information and verify the base flood elevation, if appropriate.

SECTION 5: CONCLUSIONS

5.1 SUMMARY

From a geotechnical viewpoint, the project is feasible provided the concerns listed below are addressed in the project design. Descriptions of each concern with brief outlines of our recommendations follow the listed concerns.

- Potential for liquefaction-induced settlements
- Potential for significant static settlements from fill placement and building loads
- Shallow groundwater
- Undocumented fill and loose to medium dense sandy soils
- Expansive soils
- Redevelopment considerations

5.1.1 Potential for Liquefaction-Induced Settlements

As discussed, our liquefaction analysis indicates that there is a potential for liquefaction of discontinuous sand layers across the site during a significant seismic event. Our analysis indicates total liquefaction-induced settlement up to about ½ inch could occur within proximity of the proposed building area, resulting in differential settlements on the order of about ⅓ inch between independent foundation elements. The potential for liquefied sands to vent to the ground surface through cracks in the surficial soils is low in our exploration locations in proximity of the proposed building; however, there is a moderate potential for ground rupture at CPT-9/EB-8 location. Please refer to Section 4.3.4 for additional recommendations if the potential for ground rupture at this location beyond the building footprint is to be reduced. Foundations for the building should be designed to tolerate the anticipated total and differential settlements mention above. Detailed foundation recommendations are presented in the "Foundations" section.

5.1.2 Potential for Significant Static Settlements from Fill Placement and Building Loads

As part of our evaluation, we performed settlement analyses to estimate the potential static settlements due to new fill placement and building loads. As mentioned, the finished floor elevation is anticipated to be at about Elevation 16 to 17 feet. Site grades within the building area are anticipated to be raised up to about 2 feet at the northern end and up to about 5 feet at the southern end. This additional new fill would cause settlement of the existing soils in addition to settlement due to foundation loads. We estimate total settlements from raising site grades to achieve the building finished floor elevation could be up to ½ inch on the north end and on the order of 1 to 1¾ inches on the south end.

Additionally, we evaluated static settlements due to estimated static dead plus live column loading of 50 to 150 kips and wall loading of 7 to 10 kips per foot. For conventional shallow spread footings at columns and continuous strip footings at walls, provided the bottom of footing is about 3 feet below a finished floor Elevation 16 to 17 feet, total static settlements are estimated to be on the order of about ½- to 1-inch. For continuous strip footings at walls along the loading dock on the north side of the building, with a bottom of footing at about 7 feet below finished floor Elevation 16 to 17 feet, total static settlements are estimated to be on the order of about 1½ inches. The building foundations will need to be designed to tolerate total and differential settlements due to static and liquefaction-induced settlement. Detailed foundation recommendations are presented in the "Foundations" section.

5.1.3 Shallow Groundwater

Shallow groundwater was measured at depths ranging from approximately 5 to 14 feet below the existing ground surface in our borings. Additionally, groundwater monitoring data indicates groundwater is generally at depths of 5 to 7 feet below site grades with water occasionally as shallow as about 3 feet beneath the surface at times. Shallow groundwater could significantly impact grading and underground construction. These impacts typically consist of potentially wet and unstable pavement subgrade and subgrade for over-excavations, difficulty achieving compaction, and difficult underground utility installation. Dewatering and shoring of utility trenches may be required in some isolated areas of the site. Additional recommendations addressing this concern are presented in the "Earthwork" section of this report.

As discussed, the proposed loading dock is to be located along the north end of the building and the finished surface is anticipated to be roughly 4 to 5 feet below the existing site grades based on a finished floor Elevation 16 to 17 feet. As such, subgrade for the loading dock will be close to groundwater and may be susceptible to softening in periods with higher groundwater. Depending on the final depth and elevation of the loading dock, additional mitigation and subgrade stabilization or sub-drainage system may need to be considered to reduce the potential for reduced subgrade support if water is present. We should be consulted to provided additional recommendation, if needed, based on the final elevation of the loading dock.

5.1.4 Undocumented Fill and Loose to Medium Dense Sandy Soils

As mentioned, undocumented fills were encountered within some of our borings ranging up to 7 feet beneath the surface. Additionally, due to the previous development and site history, we anticipated fills may extend deeper in some locations. Undocumented fills are expected to be variable in thickness, density, and consistency across the site. We recommend all undocumented fills blanketing the site be completely removed from within the building areas and replaced as engineered fill.

Further, some explorations in proximity to the building encountered an approximately 1-foot thick loose to medium dense native sandy layer at a depth of about 3½ to 6 feet beneath the existing surface. Due to potential for lower bearing strength and increase differential settlement, we recommend the building area be over-excavated a minimum 3 feet beneath existing site grades to recompact the lower strength sandy soils. Additional recommendations are provided in the "Earthwork" section regarding removal and recompaction of undocumented fills and the near surface loose to medium dense native sandy layer.

Additional exploration including exploratory borings and/or test pits can be performed prior to site grading to better evaluate the undocumented fills and low-strength/soil bearing layer and lateral extent. We can provide additional recommendations if this alternative is desired.

5.1.5 Expansive Soils

As discussed, highly expansive surficial soils were encountered in the near surface soils that blanket the site. Expansive soils can undergo significant volume change with changes in

moisture content. They shrink and harden when dried and expand and soften when wetted. To reduce the potential for damage to the planned structure, slabs-on-grade should have sufficient reinforcement and be supported on a layer of non-expansive fill; footings should extend below the zone of seasonal moisture fluctuation. In addition, it is important to limit moisture changes in the surficial soils by using positive drainage away from buildings as well as limiting landscaping watering. Detailed grading and foundation recommendations addressing this concern are presented in the following sections.

5.1.6 Redevelopment Considerations

The site is currently occupied by buildings and pavements. The existing improvements will be demolished for site redeveloped. Potential issues that are often associated with redeveloping sites include demolition of existing improvements, abandonment of existing utilities, and undocumented fills. Please refer to the "Earthwork" section below for further recommendations.

5.2 PLANS AND SPECIFICATIONS REVIEW

We recommend that we be retained to review the geotechnical aspects of the project structural, civil, and landscape plans and specifications, allowing sufficient time to provide the design team with any comments prior to issuing the plans for construction.

5.3 CONSTRUCTION OBSERVATION AND TESTING

As site conditions may vary significantly between the small-diameter borings performed during this investigation, we also recommend that a Cornerstone representative be present to provide geotechnical observation and testing during earthwork and foundation construction. This will allow us to form an opinion and prepare a letter at the end of construction regarding contractor compliance with project plans and specifications, and with the recommendations in our report. We will also be allowed to evaluate any conditions differing from those encountered during our investigation, and provide supplemental recommendations as necessary. For these reasons, the recommendations in this report are contingent of Cornerstone providing observation and testing during construction. Contractors should provide at least a 48-hour notice when scheduling our field personnel.

SECTION 6: EARTHWORK

6.1 SITE DEMOLITION

All existing improvements not to be reused for the current development, including all foundations, flatwork, pavements, utilities, and other improvements should be demolished and removed from the site. Recommendations in this section apply to the removal of these improvements, which may be and are currently present on the site, prior to the start of mass grading or the construction of new improvements for the project.

Cornerstone should be notified prior to the start of demolition and should be present on at least a part-time basis during all backfill and mass grading as a result of demolition. Occasionally,

other types of buried structures (wells, cisterns, debris pits, etc.) can be found on sites with prior development. If encountered, Cornerstone should be contacted to address these types of structures on a case-by-case basis.

6.1.1 Demolition of Existing Slabs, Foundations and Pavements

All slabs, foundations, and pavements should be completely removed from within planned building areas.

As an owner value-engineered option, existing slabs, foundations, and pavements that extend into planned flatwork, pavement, or landscape areas may be left in place provided there is at least 3 feet of engineered fill overlying the remaining materials, they are shown not to conflict with new utilities, and that asphalt and concrete more than 10 feet square is broken up to allow subsurface drainage. Future distress and/or higher maintenance may result from leaving these prior improvements in place. A discussion of recycling existing improvements is provided later in this report.

Special care should be taken during the demolition and removal of existing floor slabs, foundations, utilities and pavements to minimize disturbance of the subgrade. Excessive disturbance of the subgrade, which includes either native or previously placed engineered fill, resulting from demolition activities can have serious detrimental effects on planned foundation and paving elements.

Existing foundations are typically mat-slabs, shallow footings, or piers/piles. If slab or shallow footings are encountered, they should be completely removed. If drilled piers are encountered, they should be cut off at an elevation at least 60-inches below proposed footings or the final subgrade elevation, whichever is deeper. The remainder of the drilled pier could remain in place. Foundation elements to remain in place should be surveyed and superimposed on the proposed development plans to determine the potential for conflicts or detrimental impacts to the planned construction. Following review, additional mitigation or planned foundation elements may need to be modified.

6.1.2 Abandonment of Existing Utilities

All utilities should be completely removed from within planned building areas. For any utility line to be considered acceptable to remain within building areas, the utility line must be completely backfilled with grout or sand-cement slurry (sand slurry is not acceptable), the ends outside the building area capped with concrete, and the trench fills either removed and replaced as engineered fill with the trench side slopes flattened to at least 1:1, or the trench fills are determined not to be a risk to the structure. The assessment of the level of risk posed by the particular utility line will determine whether the utility may be abandoned in place or needs to be completely removed. The contractor should assume that all utilities will be removed from within building areas unless provided written confirmation from both the owner and the geotechnical engineer.

Utilities extending beyond the building area may be abandoned in place provided the ends are plugged with concrete, they do not conflict with planned improvements, and that the trench fills do not pose significant risk to the planned surface improvements.

The risk for owners associated with abandoning utilities in place include the potential for future differential settlement of existing trench fills, and/or partial collapse and potential ground loss into utility lines that are not completely filled with grout.

6.2 SITE CLEARING AND PREPARATION

6.2.1 Site Stripping

The site should be stripped of all surface vegetation, and surface and subsurface improvements to be removed within the proposed development area. Demolition of existing improvements is discussed in the prior paragraphs. A detailed discussion of removal of existing fills is provided later in this report. Surface vegetation and topsoil should be stripped to a sufficient depth to remove all material greater than 3 percent organic content by weight.

6.2.2 Tree and Shrub Removal

Trees and shrubs designated for removal should have the root balls and any roots greater than ½-inch diameter removed completely. Mature trees are estimated to have root balls extending to depths of 2 to 4 feet, depending on the tree size. Significant root zones are anticipated to extend to the diameter of the tree canopy. Grade depressions resulting from root ball removal should be cleaned of loose material and backfilled in accordance with the recommendations in the "Compaction" section of this report.

6.3 REMOVAL OF EXISTING FILLS AND OVER-EXCAVATION

We recommend the entire building area be over-excavated a minimum depth of 3 feet beneath existing site grades or full depth of the undocumented fill, whichever is deeper, and replaced as engineered fill. The over-excavation and removal of fills should extend a lateral distance of at least 5 feet beyond the building footprint or to a lateral distance equal to fill depth below the perimeter footing, whichever is greater.

Once the over-excavation is completed, the exposed subgrade should be scarified, moisture conditioned, and compacted. The minimum recommended performance specification for compaction of the base of the exposed over-excavation area should consist of a minimum of five overlapping passes with a heavy-duty, vibratory smooth drum roller (such as a Dynapac CA5000, Volvo SD160 or an approved equivalent) that will exert a minimum of 25,000 ft-lbs of energy. The above recommendations may need to be modified at the time of construction based on actual field conditions.

Subgrade preparation and compaction should be performed in accordance with the following sections. If the over-excavated materials and fills meet requirements in the "Materials for Fill" section, they can be reused as engineered fill when backfilling the building pad. If materials are

encountered that do not meet the requirements, such as debris, wood, trash, those materials should be screened out of the remaining material and be removed from the site. Backfill of the over-excavation should be placed in lifts and compacted in accordance with the "Compaction" section below.

Fills extending into planned pavement and flatwork areas may be left in place provided they are determined to be a low risk for future differential settlement and that the upper 12 to 18 inches of fill below pavement subgrade is re-worked and compacted as discussed in the "Compaction" section below.

As mentioned, additional exploration can be performed to further evaluate the presence of the lower strength sandy layer at a depth of about 3½ to 6 feet beneath existing site grades and to define the limits of over-excavation and recompaction and depth of over-excavation within the building areas.

6.3.1 High Moisture in Fills and Underlying Native Soils

As discussed, the in-situ moisture contents range up to about 20 to 25 percent over the estimated laboratory optimum in the upper 10 feet of the soil profile. Additionally, the soils may become significantly wetter during wet winter weather and at depths close to the groundwater. The contractor should anticipate drying and processing soils prior to reusing them as fill. The contractors should anticipate working with and mitigating unstable soil conditions.

6.4 TEMPORARY CUT AND FILL SLOPES

The contractor is responsible for maintaining all temporary slopes and providing temporary shoring where required. Temporary shoring, bracing, and cuts/fills should be performed in accordance with the strictest government safety standards. On a preliminary basis, the upper 10 feet at the site may be classified as OSHA Soil Type C materials.

Excavations performed during site demolition and fill removal should be sloped at 3:1 (horizontal:vertical) within the upper 5 feet below building subgrade. Excavations extending more than 5 feet below building subgrade and excavations in pavement and flatwork areas should be slope at a 1:1 inclination unless the OSHA soil classification indicates that slope should not exceed 1.5:1.

6.5 SHALLOW GROUNDWATER

As previously stated, groundwater was encountered at depths of about 5 to 14 feet in our borings corresponding to approximate Elevations -3¼ to 9½ feet (NAVD88 datum) based on the topographic survey provided. Additionally, based on previous groundwater monitoring data at the site, groundwater appears to generally be about 5 to 7 feet beneath site grades but has also been observed as shallow as 3 feet beneath the existing site grades. We recommend that contractors anticipate dewatering to control water seeping into deeper excavations close to or below the groundwater. Groundwater conditions can be difficult to maintain, and if the groundwater is in a relatively widespread, continuous layer, it may be hard to dewater, requiring

continuous dewatering during excavations. The contractors should anticipate working with and mitigating unstable soil conditions, especially when close to the groundwater depth.

6.6 SUBGRADE PREPARATION

After site clearing and demolition is complete, and prior to backfilling any excavations resulting from fill removal or demolition, the excavation subgrade and subgrade within areas to receive additional site fills, slabs-on-grade and/or pavements should be scarified to a depth of 6 inches, moisture conditioned, and compacted in accordance with the "Compaction" section below.

6.7 SUBGRADE STABILIZATION MEASURES

Soil subgrade and fill materials, especially soils with high fines contents such as clays and silty soils, can become unstable due to high moisture content, whether from high in-situ moisture contents or from winter rains. As the moisture content increases over the laboratory optimum, it becomes more likely the materials will be subject to softening and yielding (pumping) from construction loading or become unworkable during placement and compaction.

As discussed in the "Subsurface" section in this report, the in-situ moisture contents range up to about 20 to 25 percent over the estimated laboratory optimum in the upper 10 of the soil profile. The contractor should anticipate drying the soils prior to reusing them as fill. In addition, repetitive rubber-tire loading may de-stabilize the soils.

There are several methods to address potential unstable soil conditions and facilitate fill placement and trench backfill. Some of the methods are briefly discussed below. Implementation of the appropriate stabilization measures should be evaluated on a case-by-case basis according to the project construction goals and the particular site conditions.

6.7.1 Chemical Treatment

Where the unstable area exceeds about 5,000 to 10,000 square feet and/or site winterization is desired, chemical treatment with quicklime (CaO), kiln-dust, or cement may be more cost-effective than removal and replacement. Recommended chemical treatment depths will typically range from 12 to 18 inches depending on the magnitude of the instability.

6.7.2 Removal and Replacement

As an alternative to scarification, the contractor may choose to over-excavate the unstable soils and replace them with dry on-site or import materials. A Cornerstone representative should be present to provide recommendations regarding the appropriate depth of over-excavation, whether a geosynthethic (stabilization fabric or geogrid) is recommended, and what materials are recommended for backfill.

6.7.3 Scarification and Drying

The subgrade may be scarified to a depth of 8 to 12 inches and allowed to dry to near optimum conditions, if sufficient dry weather is anticipated to allow sufficient drying. More than one round of scarification may be needed to break up the soil clods.

6.8 MATERIAL FOR FILL

6.8.1 Re-Use of On-site Soils

On-site soils with an organic content less than 3 percent by weight may be reused as general fill. General fill should not have lumps, clods or cobble pieces larger than 6 inches in diameter; 85 percent of the fill should be smaller than 2½ inches in diameter. Minor amounts of oversize material (smaller than 12 inches in diameter) may be allowed provided the oversized pieces are not allowed to nest together and the compaction method will allow for loosely placed lifts not exceeding 12 inches.

6.8.2 Re-Use of On-Site Site Improvements

We anticipate that significant quantities of asphalt concrete (AC) grindings and aggregate base (AB) will be generated during site demolition. If the AC grindings are mixed with the underlying AB to meet Class 2 AB specifications, they may be reused within new pavement and flatwork structural sections. Fill containing AC grindings may not be reused within building areas. Laboratory testing will be required to confirm the grindings meet project specifications.

If the site area allows for on-site pulverization of PCC and provided the PCC is pulverized to meet the "Material for Fill" requirements of this report, it may be used as select fill within the planned building areas, excluding the capillary break layer; as typically pulverized PCC comes close to or meets Class 2 AB specifications, the recycled PCC may likely be used within the pavement structural sections. PCC grindings also make good winter construction access roads, similar to a cement-treated base (CTB) section.

6.8.3 High Moisture in Fills and Underlying Native Soils

As discussed, the in-situ moisture contents range up to about 20 to 25 percent over the estimated laboratory optimum in the upper 10 feet of the soil profile. Additionally, the soils may become significantly wetter during wet winter weather and at depths close to the groundwater. The contractor should anticipate drying and processing soils prior to reusing them as fill. The contractors should anticipate working with and mitigating unstable soil conditions.

6.8.4 Potential Import Sources

Imported and non-expansive material should be inorganic with a Plasticity Index (PI) of 15 or less, and not contain recycled asphalt concrete where it will be used within the building areas. To prevent significant caving during trenching or foundation construction, imported material should have sufficient fines. Samples of potential import sources should be delivered to our

office at least 10 days prior to the desired import start date. Information regarding the import source should be provided, such as any site geotechnical reports. If the material will be derived from an excavation rather than a stockpile, potholes will likely be required to collect samples from throughout the depth of the planned cut that will be imported. At a minimum, laboratory testing will include PI tests. Material data sheets for select fill materials (Class 2 aggregate base, ¾-inch crushed rock, quarry fines, etc.) listing current laboratory testing data (not older than 6 months from the import date) may be provided for our review without providing a sample. If current data is not available, specification testing will need to be completed prior to approval.

Environmental and soil corrosion characterization should also be considered by the project team prior to acceptance. Suitable environmental laboratory data to the planned import quantity should be provided to the project environmental consultant; additional laboratory testing may be required based on the project environmental consultant's review. The potential import source should also not be more corrosive than the on-site soils, based on pH, saturated resistivity, and soluble sulfate and chloride testing.

6.8.5 Non-Expansive Fill Using Lime Treatment

As discussed above, non-expansive fill should have a Plasticity Index (PI) of 15 or less. Due to the high clay content and PI of the on-site soil materials, it is not likely that sufficient quantities of non-expansive fill would be generated from cut materials. As an alternative to importing non-expansive fill, chemical treatment can be considered to create non-expansive fill. If this option is considered, additional laboratory tests should be performed during initial site grading to further evaluate the optimum percentage of quicklime required.

6.9 COMPACTION REQUIREMENTS

All fills, and subgrade areas where fill, slabs-on-grade, and pavements are planned, should be placed in loose lifts 8 inches thick or less and compacted in accordance with ASTM D1557 (latest version) requirements as shown in the table below. In general, clayey soils should be compacted with sheepsfoot equipment and sandy/gravelly soils with vibratory equipment; open-graded materials such as crushed rock should be placed in lifts no thicker than 18 inches and consolidated in place with vibratory equipment. Each lift of fill and all subgrade should be firm and unyielding under construction equipment loading in addition to meeting the compaction requirements to be approved. The contractor (with input from a Cornerstone representative) should evaluate the in-situ moisture conditions, as the use of vibratory equipment on soils with high moistures can cause unstable conditions. General recommendations for soil stabilization are provided in the "Subgrade Stabilization Measures" section of this report. Where the soil's PI is 20 or greater, the expansive soil criteria should be used.

Table 2: Compaction Requirements

Description	Material Description	Minimum Relative[1] Compaction (percent)	Moisture[2] Content (percent)
General Fill (within upper 5 feet)	On-Site Expansive Soils	87 – 92	>3
	Low Expansion Soils	90	>1
General Fill (below a depth of 5 feet)	On-Site Expansive Soils	95	>3
	Low Expansion Soils	95	>1
Trench Backfill	On-Site Expansive Soils	87 – 92	>3
Trench Backfill	Low Expansion Soils	90	>1
Trench Backfill (upper 6 inches of pavement subgrade)	On-Site Low Expansion Soils	95	>1
Crushed Rock Fill	¾-inch Clean Crushed Rock	Consolidate In-Place	NA
Non-Expansive Fill	Imported Non-Expansive Fill	90	Optimum
Flatwork Subgrade	On-Site Expansive Soils	87 - 92	>3
Flatwork Subgrade	Low Expansion Soils	90	>1
Flatwork Aggregate Base	Class 2 Aggregate Base[3]	90	Optimum
Pavement Subgrade	On-Site Expansive Soils	87 - 92	>3
Pavement Subgrade	Low Expansion Soils	95	>1
Pavement Aggregate Base	Class 2 Aggregate Base[3]	95	Optimum
Asphalt Concrete	Asphalt Concrete	95 (Marshall)	NA

1 – Relative compaction based on maximum density determined by ASTM D1557 (latest version)
2 – Moisture content based on optimum moisture content determined by ASTM D1557 (latest version)
3 – Class 2 aggregate base shall conform to Caltrans Standard Specifications, latest edition, except that the relative compaction should be determined by ASTM D1557 (latest version)

6.9.1 Construction Moisture Conditioning

Expansive soils can undergo significant volume change when dried then wetted. The contractor should keep all exposed expansive soil subgrade (and also trench excavation side walls) moist until protected by overlying improvements (or trenches are backfilled). If expansive soils are allowed to dry out significantly, re-moisture conditioning may require several days of re-wetting (flooding is not recommended), or deep scarification, moisture conditioning, and re-compaction.

6.10 TRENCH BACKFILL

Utility lines constructed within public right-of-way should be trenched, bedded and shaded, and backfilled in accordance with the local or governing jurisdictional requirements. Utility lines in private improvement areas should be constructed in accordance with the following requirements unless superseded by other governing requirements.

All utility lines should be bedded and shaded to at least 6 inches over the top of the lines with crushed rock (⅜-inch-diameter or greater) or well-graded sand and gravel materials conforming to the pipe manufacturer's requirements. Open-graded shading materials should be consolidated in place with vibratory equipment and well-graded materials should be compacted to at least 90 percent relative compaction with vibratory equipment prior to placing subsequent backfill materials.

General backfill over shading materials may consist of on-site native materials provided they meet the requirements in the "Material for Fill" section, and are moisture conditioned and compacted in accordance with the requirements in the "Compaction" section.

Where utility lines will cross perpendicular to strip footings, the footing should be deepened to encase the utility line, providing sleeves or flexible cushions to protect the pipes from anticipated foundation settlement, or the utility lines should be backfilled to the bottom of footing with sand-cement slurry or lean concrete. Where utility lines will parallel footings and will extend below the "foundation plane of influence," an imaginary 1:1 plane projected down from the bottom edge of the footing, either the footing will need to be deepened so that the pipe is above the foundation plane of influence or the utility trench will need to be backfilled with sand-cement slurry or lean concrete within the influence zone. Sand-cement slurry used within foundation influence zones should have a minimum compressive strength of 75 psi.

On expansive soils sites it is desirable to reduce the potential for water migration into building and pavement areas through the granular shading materials. We recommend that a plug of low-permeability clay soil, sand-cement slurry, or lean concrete be placed within trenches just outside where the trenches pass into building and pavement areas.

6.11 SITE DRAINAGE

Ponding should not be allowed adjacent to building foundations, slabs-on-grade, or pavements. Hardscape surfaces should slope at least 2 percent towards suitable discharge facilities; landscape areas should slope at least 3 percent towards suitable discharge facilities. Roof runoff should be directed away from building areas in closed conduits, to approved infiltration facilities, or on to hardscaped surfaces that drain to suitable facilities. Retention, detention or infiltration facilities should be spaced at least 10 feet from buildings, and preferably at least 5 feet from slabs-on-grade or pavements. However, if retention, detention or infiltration facilities are located within these zones, we recommend that these treatment facilities meet the requirements in the Storm Water Treatment Design Considerations section of this report.

6.12 LOW-IMPACT DEVELOPMENT (LID) IMPROVEMENTS

The Municipal Regional Permit (MRP) requires regulated projects to treat 100 percent of the amount of runoff identified in Provision C.3.d from a regulated project's drainage area with low impact development (LID) treatment measures onsite or at a joint stormwater treatment facility. LID treatment measures are defined as rainwater harvesting and use, infiltration, evapotranspiration, or biotreatment. A biotreatment system may only be used if it is infeasible to implement harvesting and use, infiltration, or evapotranspiration at a project site.

Technical infeasibility of infiltration may result from site conditions that restrict the operability of infiltration measures and devices. Various factors affecting the feasibility of infiltration treatment may create an environmental risk, structural stability risk, or physically restrict infiltration. The presence of any of these limiting factors may render infiltration technically infeasible for a proposed project. To aid in determining if infiltration may be feasible at the site, we provide the following site information regarding factors that may aid in determining the feasibility of infiltration facilities at the site.

- The near-surface soils at the site are generally clayey, and categorized as Hydrologic Soil Group D, and is expected to have infiltration rates of less than 0.2 inches per hour. In our opinion, these clayey soils will significantly limit the infiltration of stormwater.

- Locally, seasonal high groundwater is mapped at a depth of about 5 to 7 feet, and based on groundwater data at the site we anticipate may be as shallow as 3 feet beneath existing site grades. Therefore, groundwater is expected to be within 10 feet of the base of the infiltration measure.

- In our opinion, infiltration locations within 10 feet of the buildings would create a geotechnical hazard.

- Infiltration measures, devices, or facilities may conflict with the location of existing or proposed underground utilities or easements. Infiltration measures, devices, or facilities should not be placed on top of or very near to underground utilities such that they discharge to the utility trench, restrict access, or cause stability concerns.

6.12.1 Storm Water Treatment Design Considerations

If storm water treatment improvements, such as shallow bio-retention swales, basins or pervious pavements, are required as part of the site improvements to satisfy Storm Water Quality (C.3) requirements, we recommend the following items be considered for design and construction.

6.12.1.1 General Bioswale Design Guidelines

- If possible, avoid placing bioswales or basins within 10 feet of the building perimeter or within 5 feet of exterior flatwork or pavements. If bioswales must be constructed within these setbacks, the side(s) and bottom of the trench excavation should be lined with 10-mil visqueen to reduce water infiltration into the surrounding expansive clay.

- Bioswales constructed within 3 feet of proposed buildings may be within the foundation zone of influence for perimeter wall loads. Therefore, where bioswales will parallel foundations and will extend below the “foundation plane of influence,” an imaginary 1:1 plane projected down from the bottom edge of the foundation, the foundation will need to be deepened so that the bottom edge of the bioswale filter material is above the foundation plane of influence.

- The bottom of bioswale or detention areas should include a perforated drain placed at a low point, such as a shallow trench or sloped bottom, to reduce water infiltration into the surrounding soils near structural improvements, and to address the low infiltration capacity of the on-site clay soils.

6.12.1.2 Bioswale Infiltration Material

- Gradation specifications for bioswale filter material, if required, should be specified on the grading and improvement plans.

- Compaction requirements for bioswale filter material in non-landscaped areas or in pervious pavement areas, if any, should be indicated on the plans and specifications to satisfy the anticipated use of the infiltration area.

- If required, infiltration (percolation) testing should be performed on representative samples of potential bioswale materials prior to construction to check for general conformance with the specified infiltration rates.

- It should be noted that multiple laboratory tests may be required to evaluate the properties of the bioswale materials, including percolation, landscape suitability and possibly environmental analytical testing depending on the source of the material. We recommend that the landscape architect provide input on the required landscape suitability tests if bioswales are to be planted.

- If bioswales are to be vegetated, the landscape architect should select planting materials that do not reduce or inhibit the water infiltration rate, such as covering the bioswale with grass sod containing a clayey soil base.

- If required by governing agencies, field infiltration testing should be specified on the grading and improvement plans. The appropriate infiltration test method, duration and frequency of testing should be specified in accordance with local requirements.

- Due to the relatively loose consistency and/or high organic content of many bioswale filter materials, long-term settlement of the bioswale medium should be anticipated. To reduce initial volume loss, bioswale filter material should be wetted in 12 inch lifts during placement to pre-consolidate the material. Mechanical compaction should not be allowed, unless specified on the grading and improvement plans, since this could significantly decrease the infiltration rate of the bioswale materials.

- It should be noted that the volume of bioswale filter material may decrease over time depending on the organic content of the material. Additional filter material may need to be added to bioswales after the initial exposure to winter rains and periodically over the life of the bioswale areas, as needed.

6.12.1.3 Bioswale Construction Adjacent to Pavements

If bio-infiltration swales or basins are considered adjacent to proposed parking lots or exterior flatwork, we recommend that mitigative measures be considered in the design and construction of these facilities to reduce potential impacts to flatwork or pavements. Exterior flatwork, concrete curbs, and pavements located directly adjacent to bio-swales may be susceptible to settlement or lateral movement, depending on the configuration of the bioswale and the setback between the improvements and edge of the swale. To reduce the potential for distress to these improvements due to vertical or lateral movement, the following options should be considered by the project civil engineer:

- Improvements should be setback from the edge of a bioswale (assuming a sloping bioswale) such that there is at least 1 foot of horizontal distance between the edge of improvements and the top edge of the bioswale excavation for every 1 foot of vertical bioswale depth, or

- Concrete curbs for pavements, or lateral restraint for exterior flatwork, located directly adjacent to a bioswale, or not meeting the above setback, should be designed to resist lateral earth pressures in accordance with the recommendations in the “Retaining Walls” section of this report, or concrete curbs or edge restraint should be adequately keyed into the native soil or engineered to reduce the potential for rotation or lateral movement of the curbs.

6.13 LANDSCAPE CONSIDERATIONS

Since the near-surface soils are moderately to highly expansive, we recommend greatly reducing the amount of surface water infiltrating these soils near foundations and exterior slabs-on-grade. This can typically be achieved by:

- Using drip irrigation

- Avoiding open planting within 3 feet of the building perimeter or near the top of existing slopes

- Regulating the amount of water distributed to lawns or planter areas by using irrigation timers

- Selecting landscaping that requires little or no watering, especially near foundations.

We recommend that the landscape architect consider these items when developing landscaping plans.

SECTION 7: 2019 CBC SEISMIC DESIGN CRITERIA

We developed site-specific seismic design parameters in accordance with Chapter 16, Chapter 18 and Appendix J of the 2019 California Building Code (CBC) and Chapters 11, 12, 20, and 21 and Supplement No. 1 of ASCE 7-16.

7.1 SITE LOCATION AND PROVIDED DATA FOR 2019 CBC SEISMIC DESIGN

The project is located at latitude 37.719966° and longitude -122.187908°, which is based on Google Earth (WGS84) coordinates at the approximate center of the site at 880 Doolittle Drive in San Leandro, California. We have assumed that a Seismic Importance Factor (I_e) of 1.00 has been assigned to the structure in accordance with Table 1.5-2 of ASCE 7-16 for structures classified as Risk Category II. The building period has not been provided by the project structural engineer.

7.2 SITE CLASSIFICATION – CHAPTER 20 OF ASCE 7-16

Code-based site classification and ground motion attenuation relationships are based on the time-weighted average shear wave velocity of the top approximately 100 feet (30 meters) of the soil profile (V_{S30}).

Shear wave velocity (V_S) measurements were performed while advancing CPT-1 and CPT-10, resulting in a time-averaged shear wave velocity for the top 30 meters (V_{S30}) of 217 meters per second (m/s) and 225 m/s, respectively. In accordance with Table 20.3-1 of ASCE 7-16, we recommend the site be classified as Soil Classification D, which is described as a “stiff soil” profile. Because we used site specific data from our explorations and laboratory testing, the site class should be considered as “determined” for the purposes of estimating the seismic design parameters from the code outlined below. Our site-specific ground motion hazard analysis considered a V_{S30} of 217 m/s (712 ft/s).

7.3 CODE-BASED SEISMIC DESIGN PARAMETERS

Code-based spectral acceleration parameters were determined based on mapped acceleration response parameters adjusted for the specific site conditions. Mapped Risk-Adjusted Maximum Considered Earthquake (MCE_R) spectral acceleration parameters (S_S and S_1) were determined using the ATC Hazards by Location website (https://hazards.atcouncil.org).

The mapped acceleration parameters were adjusted for local site conditions based on the average soil conditions for the upper 100 feet (30 meters) of the soil profile. Code-based MCE_R spectral response acceleration parameters adjusted for site effects (S_{MS} and S_{M1}) and design spectral response acceleration parameters (S_{DS} and S_{D1}) are presented in Table 3.

In accordance with Section 11.4.8 of ASCE 7-16, structures on Site Class D sites with mapped 1-second period spectral acceleration (S_1) values greater than or equal to 0.2 require a site-specific ground motion hazard analysis be performed in accordance with Section 21.2 of ASCE 7-16. ***Design seismic parameters determined by performing a Ground Motion***

Hazard Analysis per Section 21.2 of ASCE 7-16 are presented in Table 6. Recommended values in Table 3 should not be used for design unless in the judgement of the structural engineer an exception can be taken in accordance with Section 11.4.8 of ASCE 7-16.
Values summarized in Table 3 are only used to determine Seismic Design Category and comparison with minimum code requirements for further use in our ground motion hazard analysis (GMHA).

Table 3: 2019 CBC Site Categorization and Site Coefficients

Classification/Coefficient	Design Value
Site Class	D
Site Latitude	37.719966°
Site Longitude	-122.187908°
Risk Category	II
Short Period Mapped Spectral Acceleration – S_S	1.818g
1-second Period Mapped Spectral Acceleration – S_1	0.692g
Short-Period Site Coefficient – F_a	1.0
Long-Period Site Coefficient – F_v	*null
Short Period MCE Spectral Response Acceleration Adjusted for Site Effects – S_{MS}	1.818g
1-second Period MCE Spectral Response Acceleration Adjusted for Site Effects – S_{M1}	*null
Short Period, Design Earthquake Spectral Response Acceleration – S_{DS}	1.212g
1-second Period, Design Earthquake Spectral Response Acceleration – S_{D1}	*null
Long-Period Transition – T_L	8 seconds
Site Coefficient – F_{PGA}	1.1
Site Modified Peak Ground Acceleration – PGA_M	0.840g

*null – per section 11.4.8 of ASCE 7-16

7.4 GROUND MOTION HAZARD ANALYSIS

Following Section 11.4.8 of ASCE 7-16, we performed a ground motion hazards analysis (GMHA) in accordance with Chapter 21, Section 21.2 of ASCE 7. We evaluated both Probabilistic MCE_R Ground Motions in accordance with Method 1 and Deterministic MCE_R Ground Motions to generate our recommended design response spectrum for the project.

Our analyses were performed using the USGS interface Unified Hazard Tool (UHT) based on the UCERF 3 Data Set, Building Seismic Safety Council (BSSC) Scenario Catalog 2014 event set (BSSC 2014), and the 2014 National Seismic Hazard Maps – Source Parameters (NSHMP deterministic event set). Additionally, we utilized the USGS program Response Spectra Plotter with combined models (Combined: WUS 2014 (4.1)).

Our analysis utilized the mean ground motions predicted by four of the Next Generation Attenuation West 2 (NGA-West 2) relationships: Boore-Atkinson (2013), Campbell-Bozorgnia (2013), Chiou-Youngs (2013), and Abrahamson-Silva (2013). Rotation factors (scale factors) were determined as specified in ASCE 7-16 Chapter 21, Section 21.2, to calculate the maximum rotated component of ground motions (ASCE, 2016).

7.4.1 Probabilistic MCE_R

We performed a probabilistic seismic hazard analysis (PSHA) per ASCE 7-16 Section 21.2.1. The probabilistic MCE acceleration response spectrum is defined as the 5 percent damped acceleration response spectrum having a 2 percent probability of exceedance in a 50-year period (2,475-year return period). The probabilistic MCE spectrum was multiplied by Risk Coefficients (CR) to determine the probabilistic MCE_R. We used Risk Coefficients (CR_S and CR_1) of 0.923 and 0.910, respectively, based on ASCE 7-16 Section 21.2.1.1 – Method 1 and the ATC website. Risk coefficients for the various periods are presented in Table 4, Column 3.

The resulting probabilistic MCE_R is presented on Figure 5 (red line). Spectral ordinates are tabulated in Table 4, Column 6.

7.4.2 Deterministic MCER

We performed deterministic seismic hazard analyses in accordance with ASCE 7-16 Section 21.2.2 and ASCE 7-16 Supplement No. 1. The deterministic MCE_R acceleration response spectrum is calculated as the largest 84th percentile ground motion in the direction of maximum horizontal response for each period for characteristic earthquakes on all known active faults within the region. The largest deterministic ground motion resulted from a M_w 7.58 earthquake on the Hayward Fault (RC+HN+HS+HE segments), located at a distance of approximately 5.91 km from the site.

In accordance with Supplement No.1 of ASCE 7-16, when the largest spectral response acceleration of the resulting deterministic ground motion response spectrum is less than $1.5F_a$ then the largest 84th percentile rotated response spectrum (Table 4, Column 4) shall be scaled by a single factor such that the maximum response spectral acceleration equals $1.5F_a$. For Site Classes A, B, C and D, F_a is determined using Table 11.4.1 with the value of S_s taken as 1.5; for Site Class E, F_a shall be taken as 1.0. When the largest spectral response acceleration of the probabilistic ground motion response of 21.2.1 is less than $1.2F_a$, the deterministic ground motion response spectrum does not need to be calculated.

As the largest probabilistic spectral response acceleration was determined to be 2.659 which is greater than $1.2F_a$, where F_a is taken as 1.000 from Table 11.4-1 in ASCE 7-16 Supplement No.1, the 84th percentile rotated response spectrum was calculated as part of the deterministic analyses. The maximum spectral acceleration from the 84th percentile rotated response spectrum was then compared to $1.5F_a$ to determine if a scale factor needed to be applied. The deterministic MCE spectrum are tabulated in Table 4, Column 5. The deterministic MCE_R is presented graphically on Figure 5 (blue line).

7.4.3 Site-Specific MCE_R

The site-specific MCE_R is defined by ASCE 7-16 Section 21.2.3 as the lesser of the deterministic and probabilistic MCE_R's at each period. Spectral ordinates for the site-specific MCE_R are tabulated in Table 4, Column 7 and shown graphically on Figure 5 (dashed black line).

Table 4: Development of Site-Specific MCE_R Spectrum

Period (seconds)	CBC General Spectrum (g)	Risk Coefficient	Det. 84th Percentile Rotated	Deterministic MCE_R (g)	Probabilistic MCE_R (g)	Site-Specific MCE_R (g)

5.000	0.231	0.910	0.402	0.402	0.446	0.402

7.4.4 Design Response Spectrum

The Design Response Spectrum (DRS) is defined in ASCE 7-16 Section 21.3 as:

- two-thirds of the site-specific MCE_R, but
- not less than 80% of the general design response spectrum

Spectral accelerations corresponding to two-thirds of the MCE_R are tabulated in Table 5, Column 2. Ordinates corresponding to 80% of the general Site Class D response spectrum are tabulated below in Table 5, Column 3. Ordinates of the site-specific DRS are tabulated in

Table 5, Column 4. Development of the site-specific DRS is presented graphically on Figure 6 (dashed black line).

Table 5: Development of Site-Specific Design Response Spectrum

Period (seconds)	2/3 Site-Specific MCE_R (g)	80% CBC General Spectrum (g)	Design Response Spectrum (g)
0.000	0.651	0.388	0.651
0.050	0.652	0.541	0.652
0.100	0.947	0.694	0.947

5.000	0.268	0.185	0.268

7.5 DESIGN ACCELERATION PARAMETERS

Design acceleration parameters (S_{DS} and S_{D1}) were determined in accordance with Section 21.4 of ASCE 7-16. S_{DS} is defined as the design spectral acceleration at 90% of the maximum spectral acceleration, S_a, obtained from the site-specific spectrum, at any period within the range from 0.2 to 5 seconds, inclusive. S_{D1} is defined as the maximum value of the product, TS_a, for periods from 1 to 2 seconds for sites with $v_{s,30}$ > 1,200 ft/s ($v_{s,30}$ > 365.76 m/s) and for periods from 1 to 5 seconds for sites with $v_{s,30}$ ≤ 1,200 ft/s ($v_{s,30}$ ≤365.76 m/s).

Site-specific MCE_R spectral response acceleration parameters (S_{MS} and S_{M1}) are calculated as:

- 1.5 times the S_{DS} and S_{D1} values, respectively, but
- not less than 80% of the code-based values presented in Table 3.

Recommended design acceleration parameters are summarized in Table 6.

When using the Equivalent Lateral Force Procedure, ASCE 7-16 Section 21.4 allows using the spectral acceleration at any period (T) in lieu of S_{D1}/T in Eq. 12.8-3 and $S_{D1}T_L/T_2$ in Eq. 12.8-4. The site-specific spectral acceleration at any period may be calculated by interpolation of the spectral ordinates in Table 5, Column 4.

Table 6: Site-Specific Design Acceleration Parameters

Parameter	Value
S_{DS}	1.369
S_{D1}	1.485
S_{MS}	2.053
S_{M1}	2.228

7.6 SITE-SPECIFIC MCE_G PEAK GROUND ACCELERATION

We calculated the Site-Specific MCE_G Peak Ground Acceleration (PGA_M) per ASCE 7-16 Section 21.5. The Site-Specific PGA_M is calculated as the lesser of probabilistic and deterministic geometric mean PGA. The 2% in 50-year probabilistic geometric mean PGA is 0.981g. The deterministic PGA is considered the greater of the largest 84th percentile deterministic geometric mean PGA (0.887g) or one-half of the tabulated F_{PGA} value from ASCE 7-16 Table 11.8.1 with the value of PGA taken as 0.5g. For Site Class D, F_{PGA} is 1.100 and one-half of the F_{PGA} is 0.55g; therefore, the deterministic PGA is 0.887g. Additionally, the Site-Specific PGA_M may not be less than 80% of the mapped PGA_M determined from ASCE 7-16 Equation 11.8-1. The mapped PGA_M for the site is 0.840g; 80% of PGA_M is 0.672g.

Based on the above, the recommended Site-Specific PGA_M for the site is 0.887g.

SECTION 8: FOUNDATIONS

8.1 SUMMARY OF RECOMMENDATIONS

In our opinion, the proposed structures may be supported on shallow foundations provided the recommendations in the “Earthwork” section and the sections below are followed.

8.2 SHALLOW FOUNDATIONS

8.2.1 Spread Footings

Provided the structures can tolerate the estimated static and seismic total and differential settlements, conventional spread footings can be considered for building support. Spread footings should bear entirely on natural, undisturbed soil or engineered fill, be at least 15 inches wide, and extend at least 21 inches below the lowest adjacent grade. Lowest adjacent grade is

defined as the deeper of the following: 1) bottom of the adjacent interior slab-on-grade, or 2) finished exterior grade, excluding landscaping topsoil.

Footings constructed to the above dimensions and in accordance with the "Earthwork" recommendations of this report are capable of supporting maximum allowable bearing pressures of 2,000 psf for dead loads, 3,000 psf for combined dead plus live loads, and 4,000 psf for all loads including wind and seismic. These pressures are based on factors of safety of 3.0, 2.0, and 1.5 applied to the ultimate bearing pressure for dead, dead plus live, and all loads, respectively. These pressures are net values; the weight of the footing may be neglected for the portion of the footing extending below grade (typically, the full footing depth). Top and bottom mats of reinforcing steel should be included in continuous footings to help span irregularities and differential settlement.

8.2.2 Footing Settlement

Structural loads were not provided to us at the time this report was prepared. Based on estimated building loads (up to 150 kips dead plus live column loads and up to 10 kips per foot dead plus live wall loads), the allowable bearing pressures presented above, and assumed bottom of interior column footings and non-loading dock continuous wall footings at about 3 feet below finished floor at about Elevation 13 to 14 feet and loading dock continuous wall footings at about 7 feet below finished floor at about Elevation 9 to 10 feet, we estimated the following total static footing settlements:

- ½ to 1 inch for column square spread footings and non-loading dock continuous strip wall footings.

- 1¼ to 1½ inches for loading dock continuous strip wall footings.

Due to foundation loads only, post-construction differential settlements between adjacent foundation elements or over about 30 feet along continuous strip footings are estimated to be:

- ½ inch or less for column square spread footings and non-loading dock continuous strip wall footings.

- ⅔ to ¾ inch for loading dock continuous strip wall footings.

In addition to the estimated static footing settlements presented above, we estimate differential seismic movement between independent foundation elements will be on the order of ⅓ inch (provided all undocumented fills are over-excavated and replaced as engineered fill as previously discussed).

Furthermore, based on a finished floor Elevation 16 to 17 feet across the building, existing grades will be raised about 0 to 2 feet along the north end of the building and about 4 to 5 feet along the south end of the building to achieve finished floor. In addition to the static foundation and seismic settlements discussed above, the building should be designed to accommodate the

following estimated settlements due to additional fill to raise existing grades up to the finished floor elevation:

- 0 to ½ inch in the northern end of the building (grades raised 0 to 2 feet).
- ¾ to 1¼ inches in the middle portion of the building (grades raised 3 to 4 feet).
- 1 to 1¾ inches in the southern end of the building (grades raised 4 to 5 feet).

Total differential footing movement is estimated to range from:

- ¾ to 1⅓ inches for column square spread footings and non-loading dock continuous strip wall footings.
- 1 to 1⅓ inches for loading dock continuous strip wall footings.

These static plus seismic differential movements are anticipated between independent foundation elements, or over about 30 feet along the continuous perimeter foundations. We recommend we be retained to review the final footing layout and loading, and verify the settlement estimates above.

8.2.3 Lateral Loading

Lateral loads may be resisted by friction between the bottom of footing and the supporting subgrade, and also by passive pressures generated against footing sidewalls. An ultimate frictional resistance of 0.4 applied to the footing dead load, and an ultimate passive pressure based on an equivalent fluid pressure of 450 pcf may be used in design. The structural engineer should apply an appropriate factor of safety (such as 1.5) to the ultimate values above. Where footings are adjacent to landscape areas without hardscape, the upper 18 inches of soil should be neglected when determining passive pressure capacity.

8.2.4 Spread Footing Construction Considerations

Where utility lines will cross perpendicular to strip footings, the footing should be deepened to encase the utility line, providing sleeves or flexible cushions to protect the pipes from anticipated foundation settlement, or the utility lines should be backfilled to the bottom of footing with sand-cement slurry or lean concrete. Where utility lines will parallel footings and will extend below the "foundation plane of influence," an imaginary 1:1 plane projected down from the bottom edge of the footing, either the footing will need to be deepened so that the pipe is above the foundation plane of influence or the utility trench will need to be backfilled with sand-cement slurry or lean concrete within the influence zone. Sand-cement slurry used within foundation influence zones should have a minimum compressive strength of 75 psi.

Footing excavations should be filled as soon as possible or be kept moist until concrete placement by regular sprinkling to prevent desiccation. A Cornerstone representative should observe all footing excavations prior to placing reinforcing steel and concrete. If there is a

significant schedule delay between our initial observation and concrete placement, we may need to re-observe the excavations.

Some pockets of sandy soils may be encountered within footing excavations. If encountered, excavation walls may not stand vertical and may need to be sloped to a minimum 1:1 inclination or Stay-Form or similar be placed within the footing excavations as they are excavated during construction of the foundation elements. If granular material is encountered in the footing bottoms, the material may also be disturbed to a depth of 6 to 8 inches following excavation and may need to be compacted prior to steel placement. Care should be taken to not disturb the compacted granular material during steel placement. We should re-observe the footing excavations in granular materials after reinforcing steel has been placed and just prior to concrete placement. Footing excavations should also be kept moist by regular sprinkling with water to prevent desiccation and potential raveling of the granular materials. As an alternative, a rat slab can be placed over the granular material after we have observed the footing excavation to protect the granular material prior to steel placement.

Further, groundwater is anticipated to be shallow and the existing soils are highly wet in locations. Footing excavations, especially deeper excavations (i.e. loading dock wall footings) may encounter groundwater or highly wet soils. Contractors should anticipate encountering these conditions and needing to remove groundwater and stabilize excavation bottoms prior to steel placement and concrete.

8.3 ALTERNATIVE FOUNDATIONS

If the above settlements exceed structural requirements and a shallow spread footing system is determined not feasible or if an alternative foundation system is desired by the design team, we should be consulted to provided additional foundation recommendations.

SECTION 9: CONCRETE SLABS AND PEDESTRIAN PAVEMENTS

9.1 OFFICE SLABS-ON-GRADE

As Plasticity Index (PI) tests of the surficial soils indicate high expansion potential, the proposed slabs-on-grade should be supported on 18 inches of non-expansive fill (NEF) over subgrade prepared in accordance with the recommendations in the “Earthwork” section of this report. If moisture-sensitive floor coverings are planned, the recommendations in the “Interior Slabs Moisture Protection Considerations” section below may be incorporated in the project design if desired. If significant time elapses between initial subgrade preparation and NEF and slab-on-grade construction, the subgrade should be proof-rolled to confirm subgrade stability, and if the soil has been allowed to dry out, the subgrade should be re-moisture conditioned in accordance with the “Compaction” section of this report.

The structural engineer should determine the appropriate slab reinforcement for the loading requirements and considering the expansion potential of the underlying soils. Consideration should be given to limiting the control joint spacing to a maximum of about 2 feet in each direction for each inch of concrete thickness.

9.2 WAREHOUSE SLABS-ON-GRADE

Warehouse slabs-on-grade should be at least 6 inches thick, should have a minimum compressive strength of 3,500 psi, and should be designed for the specific warehouse loading (ie. Forklifts, rack loads, etc.). At this time, rack loading information, etc. was not available. During design of the slab, we should be consulted to provide subgrade modulus for design of the slab based on anticipated loading conditions (e.g. rack, forklift, etc.), if needed. The slab should also be designed to accommodate potential slab settlement beneath heavily loaded slab areas. We recommend we be retained to review the final heavily loaded (i.e. rack loading) layout and loading, and provide estimated settlements.

Warehouse slabs-on-grade should also be supported on at least 6 inches of crushed granular base having an R-value of at least 50 and no more than 10 percent passing the No. 200 sieve, such as Class 2 aggregate base. Due to the high plasticity of the surficial soils, an additional 12 inches of non-expansive fill (NEF) should underlie the upper granular base. All base and sub-base materials should be placed and compacted in accordance with the "Compaction" section of this report. If there will be areas within the warehouse that are moisture sensitive, such as equipment and elevator rooms, a vapor barrier may be placed over the upper granular base prior to slab construction. Please refer to the recommendations in the "Interior Slabs Moisture Protection Considerations" section for vapor barrier construction. Consideration should be given to limiting the control joint spacing to a maximum of about 2 feet in each direction for each inch of concrete thickness.

9.3 INTERIOR SLABS MOISTURE PROTECTION CONSIDERATIONS

The following general guidelines for concrete slab-on-grade construction where floor coverings are planned are presented for the consideration by the developer, design team, and contractor. These guidelines are based on information obtained from a variety of sources, including the American Concrete Institute (ACI) and are intended to reduce the potential for moisture-related problems causing floor covering failures, and may be supplemented as necessary based on project-specific requirements. The application of these guidelines or not will not affect the geotechnical aspects of the slab-on-grade performance.

- Place a minimum 10-mil vapor retarder conforming to ASTM E 1745, Class C requirements or better directly below the concrete slab; the vapor retarder should extend to the slab edges and be sealed at all seams and penetrations in accordance with manufacturer's recommendations and ASTM E 1643 requirements. A 4-inch-thick capillary break, consisting of crushed rock should be placed below the vapor retarder and consolidated in place with vibratory equipment. The mineral aggregate shall be of such size that the percentage composition by dry weight as determined by laboratory sieves will conform to the following gradation:

Sieve Size	Percentage Passing Sieve
1"	100
¾"	90 – 100
No. 4	0 - 10

The capillary break rock may be considered as the upper 4 inches of the non-expansive fill previously recommended.

- The concrete water:cement ratio should be 0.45 or less. Mid-range plasticizers may be used to increase concrete workability and facilitate pumping and placement.
- Water should not be added after initial batching unless the slump is less than specified and/or the resulting water:cement ratio will not exceed 0.45.
- Polishing the concrete surface with metal trowels is not recommended.
- Where floor coverings are planned, all concrete surfaces should be properly cured.
- Water vapor emission levels and concrete pH should be determined in accordance with ASTM F1869-98 and F710-98 requirements and evaluated against the floor covering manufacturer's requirements prior to installation.

9.4 EXTERIOR FLATWORK

Exterior concrete flatwork subject to pedestrian and/or occasional light pick up loading should be at least 4 inches thick and supported on at least 12 inches of non-expansive fill (NEF) overlying subgrade prepared in accordance with the "Earthwork" recommendations of this report. In addition, the upper 4 inches of NEF should also meet Class 2 aggregate base requirements. Flatwork that will be subject to heavier or frequent vehicular loading should be designed in accordance with the recommendations in the "Vehicular Pavements" section below. To help reduce the potential for uncontrolled shrinkage cracking, adequate expansion and control joints should be included. Consideration should be given to limiting the control joint spacing to a maximum of about 2 feet in each direction for each inch of concrete thickness. Flatwork should be isolated from adjacent foundations or retaining walls except where limited sections of structural slabs are included to help span irregularities in retaining wall backfill at the transitions between at-grade and on-structure flatwork.

SECTION 10: VEHICULAR PAVEMENTS

10.1 ASPHALT CONCRETE

The following asphalt concrete pavement recommendations tabulated below are based on the Procedure 608 of the Caltrans Highway Design Manual, estimated traffic indices for various pavement-loading conditions, and on a design R-value of 5. The design R-value was chosen based on engineering judgement considering the existing surface conditions and potential variable surface conditions following site grading. We have also included pavement structural section alternatives for chemical-treated (lime/cement) subgrade soil with an estimated design R-value of 50 for your consideration. If it is desired to chemical-treat, we recommend that the upper 12 inches of subgrade soil be treated. Additional testing will need to be performed to determine the appropriate lime/cement percentage to be mixed with the subgrade soil.

Table 7: Asphalt Concrete Pavement Recommendations (Untreated Subgrade)

Design Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base* (inches)	Total Pavement Section Thickness (inches)
4.0	2.5	7.5	10.0
4.5	2.5	9.5	12.0
5.0	3.0	10.0	13.0
5.5	3.0	12.0	15.0
6.0	3.5	13.0	16.5
6.5	4.0	14.0	18.0
7.0	4.0	16.0	20.0
7.5	4.5	17.0	21.5
8.0	5.0	18.0	23.0
8.5	5.0	20.0	25.0
9.0	5.5	21.0	26.5
9.5	6.0	22.0	28.0
10.0	6.5	23.0	29.5
10.5	6.5	25.0	31.5
11.0	7.0	26.0	33.0

*Caltrans Class 2 aggregate base; minimum R-value of 78.

Table 8: Asphalt Concrete Pavement Recommendations (Chemical-Treated Subgrade)

Design Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base* (inches)	Total Pavement Section Thickness (inches)
4.0/4.5	2.5	4.0	6.5
5.0/5.5	3.0	4.0	7.0
6.0	3.5	4.0	7.5
6.5	4.0	4.0	8.0
7.0	4.0	4.5	8.5
7.5	4.5	5.0	9.5
8.0	5.0	5.0	10.0
8.5	5.0	6.5	11.5
9.0	5.5	6.5	12.0
9.5	6.0	7.0	13.0

Table 8 Continues

Table 8: Asphalt Concrete Pavement Recommendations (Chemical-Treated Subgrade) (Continued)

Design Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base* (inches)	Total Pavement Section Thickness (inches)
10.0	6.0	8.0	14.0
10.5	6.5	8.5	15.0
11.0	7.0	8.5	15.5

*Caltrans Class 2 aggregate base with minimum R-value of 78; minimum chemical-treated subgrade R-value assumed to be 50

Frequently, the full asphalt concrete section is not constructed prior to construction traffic loading. This can result in significant loss of asphalt concrete layer life, rutting, or other pavement failures. To improve the pavement life and reduce the potential for pavement distress through construction, we recommend the full design asphalt concrete section be constructed prior to construction traffic loading. Alternatively, a higher traffic index may be chosen for the areas where construction traffic will be using the pavements.

Asphalt concrete pavements constructed on expansive subgrade where the adjacent areas will not be irrigated for several months after the pavements are constructed may experience longitudinal cracking parallel to the pavement edge. These cracks typically form within a few feet of the pavement edge and are due to seasonal wetting and drying of the adjacent soil. The cracking may also occur during construction where the adjacent grade is allowed to significantly dry during the summer, pulling moisture out of the pavement subgrade. Any cracks that form should be sealed with bituminous sealant prior to the start of winter rains. One alternative to reduce the potential for this type of cracking is to install a moisture barrier at least 24 inches deep behind the pavement curb.

10.2 PORTLAND CEMENT CONCRETE

The exterior Portland Cement Concrete (PCC) pavement recommendations tabulated below are based on methods presented in the Portland Cement Association (PCA) design manual (PCA, 1984). We have provided a few pavement alternatives as an anticipated Average Daily Truck Traffic (ADTT) was not provided. An allowable ADTT should be chosen that is greater than what is expected for the development. PCC alternatives for chemical-treated (lime/cement) subgrade are also provided in the tables below.

Table 9: PCC Pavement Recommendations (Untreated Subgrade)

Allowable ADTT	Minimum PCC Thickness (inches)
13	5.5
130	6.0

Table 10: PCC Pavement Recommendations (Chemical-Treated Subgrade)

Allowable ADTT	Minimum PCC Thickness (inches)
13	5.0
150	5.5

The PCC thicknesses above are based on a concrete compressive strength of at least 3,500 psi, supporting the PCC on at least 6 inches of Class 2 aggregate base compacted as recommended in the "Earthwork" section, and laterally restraining the PCC with curbs or concrete shoulders. Adequate expansion and control joints should be included. Consideration should be given to limiting the control joint spacing to a maximum of about 2 feet in each direction for each inch of concrete thickness. Due to the expansive surficial soils present, we recommend that the construction and expansion joints be dowelled.

10.3 TRASH ENCLOSURES

Trash enclosures and the associated stress pads should consist of at least 8 inches of Portland cement concrete (PCC) over at least 6 inches of Class 2 aggregate base, where the aggregate base should be compacted to 95 percent relative compaction. The top 6 inches of the underlying subgrade should be moisture conditioned and compacted according to the "Compaction" section of this report. The compressive strength and construction details should be consistent with the above recommendations for PCC pavements.

10.4 PAVEMENT CUTOFF

Surface water penetration into the pavement section can significantly reduce the pavement life, due to the native expansive clays. While quantifying the life reduction is difficult, a normal 20-year pavement design could be reduced to less than 10 years; therefore, increased long-term maintenance may be required.

It would be beneficial to include a pavement cut-off, such as deepened curbs, redwood-headers, or "Deep-Root Moisture Barriers" that are keyed at least 4 inches into the pavement subgrade. This will help limit the additional long-term maintenance.

SECTION 11: RETAINING WALLS

11.1 STATIC LATERAL EARTH PRESSURES

The structural design of any site retaining wall should include resistance to lateral earth pressures that develop from the soil behind the wall, any undrained water pressure, and surcharge loads acting behind the wall. Provided a drainage system is constructed behind the wall to prevent the build-up of hydrostatic pressures as discussed in the section below, we recommend that the walls with level backfill be designed for the following pressures:

Table 11: Recommended Lateral Earth Pressures

Wall Condition	Lateral Earth Pressure*	Additional Surcharge Loads
Unrestrained – Cantilever Wall	45 pcf	⅓ of vertical loads at top of wall
Restrained – Braced Wall	45 pcf + 8H** psf	½ of vertical loads at top of wall

* Lateral earth pressures are based on an equivalent fluid pressure for level backfill conditions
** H is the distance in feet between the bottom of footing and top of retained soil

If adequate drainage cannot be provided behind the wall, an additional equivalent fluid pressure of 40 pcf should be added to the values above for both restrained and unrestrained walls for the portion of the wall that will not have drainage. Damp proofing or waterproofing of the walls may be considered where moisture penetration and/or efflorescence are not desired.

11.2 SEISMIC LATERAL EARTH PRESSURES

The 2019 CBC states that lateral pressures from earthquakes should be considered in the design of basements and retaining walls greater than 6 feet in height. At this time, we are not aware of any retaining walls 6 feet or greater in height and have not provided seismic earth pressures with this report. If retaining walls greater than 6 feet in height are proposed, we should be retained to provide seismic earth pressures, if warranted. In our opinion, seismic earth pressures are not warranted for design of minor landscape retaining walls (i.e. walls 6 feet or less in height).

11.3 WALL DRAINAGE

Adequate drainage should be provided by a subdrain system behind all walls. This system should consist of a 4-inch minimum diameter perforated pipe placed near the base of the wall (perforations placed downward). The pipe should be bedded and backfilled with Class 2 Permeable Material per Caltrans Standard Specifications, latest edition. The permeable backfill should extend at least 12 inches out from the wall and to within 2 feet of outside finished grade. Alternatively, ½-inch to ¾-inch crushed rock may be used in place of the Class 2 Permeable Material provided the crushed rock and pipe are enclosed in filter fabric, such as Mirafi 140N or approved equivalent. The upper 2 feet of wall backfill should consist of compacted on-site soil. The subdrain outlet should be connected to a free-draining outlet or sump.

Miradrain, Geotech Drainage Panels, or equivalent drainage matting can be used for wall drainage as an alternative to the Class 2 Permeable Material or drain rock backfill. Horizontal strip drains connecting to the vertical drainage matting may be used in lieu of the perforated pipe and crushed rock section. The vertical drainage panel should be connected to the perforated pipe or horizontal drainage strip at the base of the wall, or to some other closed or through-wall system such as the TotalDrain system from AmerDrain. Sections of horizontal drainage strips should be connected with either the manufacturer's connector pieces or by pulling back the filter fabric, overlapping the panel dimples, and replacing the filter fabric over the connection. At corners, a corner guard, corner connection insert, or a section of crushed rock covered with filter fabric must be used to maintain the drainage path.

Drainage panels should terminate 18 to 24 inches from final exterior grade. The Miradrain panel filter fabric should be extended over the top of and behind the panel to protect it from intrusion of the adjacent soil.

11.4 BACKFILL

Where surface improvements will be located over the retaining wall backfill, backfill placed behind the walls with a PI less than 20 should be compacted to at least 95 percent relative compaction using light compaction equipment. If the soil's PI is 20 or greater, expansive soil criteria should be used as discussed in the "Compaction" section of this report. Where no surface improvements are planned, backfill should be compacted to at least 90 percent for soils with a PI less than 20. Expansive soil criteria should be followed for soils with a PI of 20 or greater. If heavy compaction equipment is used, the walls should be temporarily braced.

11.5 FOUNDATIONS

Retaining walls may be supported on a continuous spread footing designed in accordance with the recommendations presented in the "Foundations" section of this report.

SECTION 12: LIMITATIONS

This report, an instrument of professional service, has been prepared for the sole use of PROLOGIS specifically to support the design of the 880 Doolittle Drive Warehouse project in San Leandro, California. The opinions, conclusions, and recommendations presented in this report have been formulated in accordance with accepted geotechnical engineering practices that exist in Northern California at the time this report was prepared. No warranty, expressed or implied, is made or should be inferred.

Recommendations in this report are based upon the soil and groundwater conditions encountered during our subsurface exploration. If variations or unsuitable conditions are encountered during construction, Cornerstone must be contacted to provide supplemental recommendations, as needed.

PROLOGIS may have provided Cornerstone with plans, reports and other documents prepared by others. PROLOGIS understands that Cornerstone reviewed and relied on the information presented in these documents and cannot be responsible for their accuracy.

Cornerstone prepared this report with the understanding that it is the responsibility of the owner or his representatives to see that the recommendations contained in this report are presented to other members of the design team and incorporated into the project plans and specifications, and that appropriate actions are taken to implement the geotechnical recommendations during construction.

Conclusions and recommendations presented in this report are valid as of the present time for the development as currently planned. Changes in the condition of the property or adjacent properties may occur with the passage of time, whether by natural processes or the acts of other persons. In addition, changes in applicable or appropriate standards may occur through legislation or the broadening of knowledge. Therefore, the conclusions and recommendations presented in this report may be invalidated, wholly or in part, by changes beyond Cornerstone's control. This report should be reviewed by Cornerstone after a period of three (3) years has elapsed from the date of this report. In addition, if the current project design is changed, then Cornerstone must review the proposed changes and provide supplemental recommendations, as needed.

An electronic transmission of this report may also have been issued. While Cornerstone has taken precautions to produce a complete and secure electronic transmission, please check the electronic transmission against the hard copy version for conformity.

Recommendations provided in this report are based on the assumption that Cornerstone will be retained to provide observation and testing services during construction to confirm that conditions are similar to that assumed for design, and to form an opinion as to whether the work has been performed in accordance with the project plans and specifications. If we are not retained for these services, Cornerstone cannot assume any responsibility for any potential claims that may arise during or after construction as a result of misuse or misinterpretation of Cornerstone's report by others. Furthermore, Cornerstone will cease to be the Geotechnical-Engineer-of-Record if we are not retained for these services.

PROJECT NO. 555-16-1

September 8, 2020 | MJS

APPENDIX A: FIELD INVESTIGATION

The field investigation consisted of a surface reconnaissance and a subsurface exploration program using truck-mounted, hollow-stem auger drilling equipment and 20-ton truck-mounted Cone Penetration Test equipment. Twelve 8-inch-diameter exploratory borings were drilled on June 1 to 5, 2020 to depths of 7 to 35 feet. Ten CPT soundings were also performed in accordance with ASTM D 5778-95 (revised, 2002) on May 18 to 20, 2020, to depths ranging from about 50 to 140 feet. The approximate locations of exploratory borings and CPTs are shown on the Site Plan, Figure 2. The soils encountered were continuously logged in the field by our representative and described in accordance with the Unified Soil Classification System (ASTM D2488). Boring logs, as well as a key to the classification of the soil, are included as part of this appendix.

Boring and CPT locations were approximated using existing site boundaries, a hand held GPS unit, and other site features as references. Boring elevations were based on interpolation of the topographic survey performed by Kimley Horn. The locations and elevations of the borings and CPTs should be considered accurate only to the degree implied by the method used.

Representative soil samples were obtained from the borings at selected depths. All samples were returned to our laboratory for evaluation and appropriate testing. The standard penetration resistance blow counts were obtained by dropping a 140-pound hammer through a 30-inch free fall. The 2-inch O.D. split-spoon sampler was driven 18 inches and the number of blows was recorded for each 6 inches of penetration (ASTM D1586). 2.5-inch I.D. samples were obtained using a Modified California Sampler driven into the soil with the 140-pound hammer previously described. Relatively undisturbed samples were also obtained with 2.875-inch I.D. Shelby Tube sampler which were hydraulically pushed. Unless otherwise indicated, the blows per foot recorded on the boring log represent the accumulated number of blows required to drive the last 12 inches. The various samplers are denoted at the appropriate depth on the boring logs.

The CPT involved advancing an instrumented cone-tipped probe into the ground while simultaneously recording the resistance at the cone tip (q_c) and along the friction sleeve (f_s) at approximately 5-centimeter intervals. Based on the tip resistance and tip to sleeve ratio (R_f), the CPT classified the soil behavior type and estimated engineering properties of the soil, such as equivalent Standard Penetration Test (SPT) blow count, internal friction angle within sand layers, and undrained shear strength in silts and clays. A pressure transducer behind the tip of the CPT cone measured pore water pressure (u_2). Graphical logs of the CPT data is included as part of this appendix.

Field tests included an evaluation of the unconfined compressive strength of the soil samples using a pocket penetrometer device. The results of these tests are presented on the individual boring logs at the appropriate sample depths.

Attached boring and CPT logs and related information depict subsurface conditions at the locations indicated and on the date designated on the logs. Subsurface conditions at other locations may differ from conditions occurring at these boring and CPT locations. The passage of time may result in altered subsurface conditions due to environmental changes. In addition,

any stratification lines on the logs represent the approximate boundary between soil types and the transition may be gradual.

UNIFIED SOIL CLASSIFICATION (ASTM D-2487-98)

CORNERSTONE EARTH GROUP

PROJECT NAME Doolittle Drive Warehouse
PROJECT NUMBER 555-16-1
PROJECT LOCATION San Leandro, CA

DATE STARTED 6/5/20 **DATE COMPLETED** 6/5/20
GROUND ELEVATION 13.75 FT +/- **BORING DEPTH** 25 ft.
DRILLING CONTRACTOR Exploration Geoservices
LATITUDE 37.720000° **LONGITUDE** -122.187009°
DRILLING METHOD Mobile B-61, 8 inch Hollow-Stem Auger
GROUND WATER LEVELS:
LOGGED BY BCG
AT TIME OF DRILLING 6.5 ft.
NOTES
AT END OF DRILLING 5 ft.

This log is a part of a report by Cornerstone Earth Group, and should not be used as a stand-alone document. This description applies only to the location of the exploration at the time of drilling. Subsurface conditions may differ at other locations and may change at this location with time. The description presented is a simplification of actual conditions encountered. Transitions between soil types may be gradual.

COMMENT:

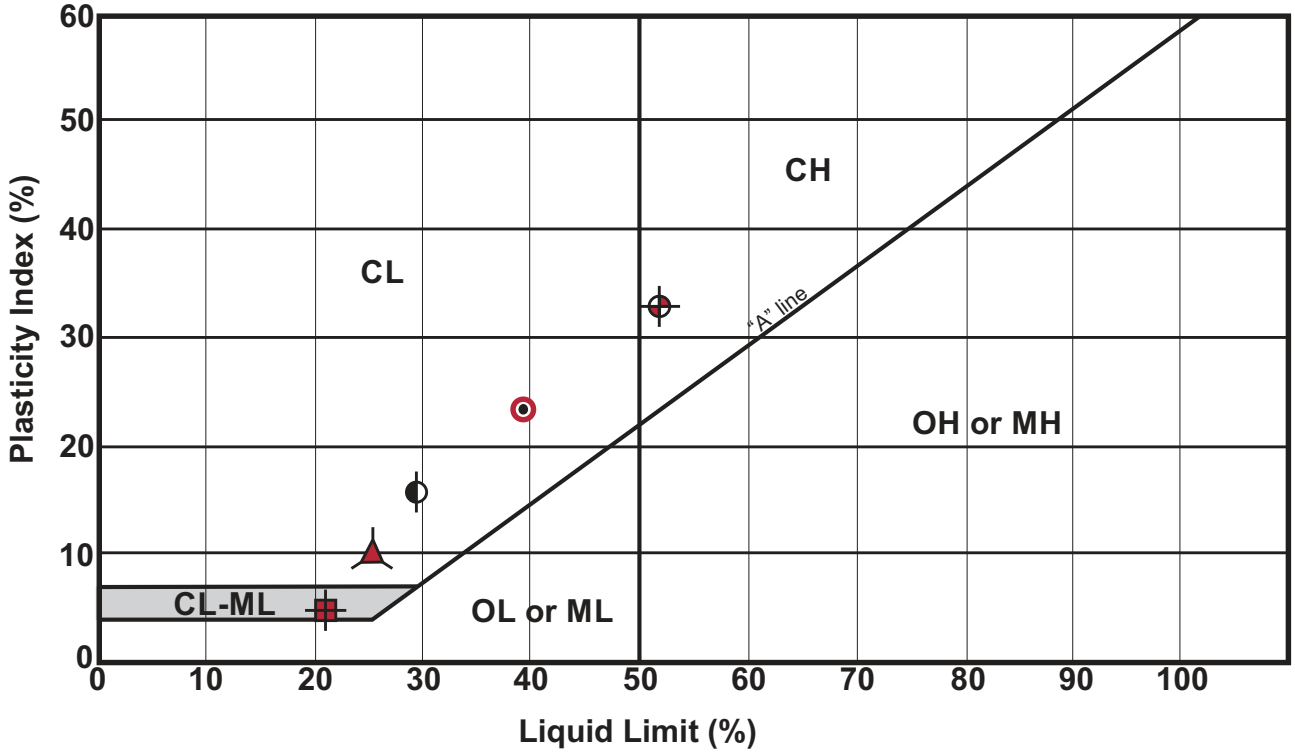
APPENDIX B: LABORATORY TEST PROGRAM

The laboratory testing program was performed to evaluate the physical and mechanical properties of the soils retrieved from the site to aid in verifying soil classification.

Moisture Content: The natural water content was determined (ASTM D2216) on 89 samples of the materials recovered from the borings. These water contents are recorded on the boring logs at the appropriate sample depths.

Dry Densities: In place dry density determinations (ASTM D2937) were performed on 80 samples to measure the unit weight of the subsurface soils. Results of these tests are shown on the boring logs at the appropriate sample depths.



Washed Sieve Analyses: The percent soil fraction passing the No. 200 sieve (ASTM D1140) was determined on 10 samples of the subsurface soils to aid in the classification of these soils. Results of these tests are shown on the boring logs at the appropriate sample depths.

Plasticity Index: Five Plasticity Index determinations (ASTM D4318) were performed on samples of the subsurface soils to measure the range of water contents over which the material exhibits plasticity. The Plasticity Index was used to classify the soil in accordance with the Unified Soil Classification System and to evaluate the soil expansion potential. Results of these tests are shown on the boring logs at the appropriate sample depths.

Undrained-Unconsolidated Triaxial Shear Strength: The undrained shear strength was determined on three relatively undisturbed sample(s) by unconsolidated-undrained triaxial shear strength testing (ASTM D2850). The results of this test are included as part of this appendix.

Consolidation: Two consolidation tests (ASTM D2435) were performed on relatively undisturbed samples of the subsurface clayey soils to assist in evaluating the compressibility property of this soil. Results of the consolidation tests are presented graphically in this appendix.

Plasticity Index (ASTM D4318) Testing Summary

Symbol	Boring No.	Depth (ft)	Natural Water Content (%)	Liquid Limit (%)	Plastic Limit (%)	Plasticity Index	Passing No. 200 (%)	Group Name (USCS - ASTM D2487)
⊕	EB-2	1.5	33	52	19	33	—	Fat Clay (CH)
⊞	EB-2	5.0	20	21	16	5	31	Silty Clayey Sand (SC-SM)(CL-ML fines)
◉	EB-2	15.5	28	39	16	23	38	Clayey Sand (SC) (CL fines)
▲	EB-4	4.5	18	25	15	10	38	Clayey Sand (SC) (CL fines)
◐	EB-4	15.0	22	29	13	16	49	Clayey Sand (SC) (CL fines)

Samples prepared in accordance with ASTM D421

1. INTRODUCTION

The following transportation impact analysis (TIA) has been prepared to determine potential Vehicle Miles Traveled (VMT) impacts and/or Level of Service (LOS) deficiencies associated with the proposed 880 Doolittle Drive project ("Project") in the City of San Leandro, CA. The project proposes to redevelop the existing building to become a warehousing and distribution spec building totaling 239,573 square feet.

Figure 1 illustrates the location of the project site in relation to the adjacent roadway network. The site would be accessed by an unsignalized full access driveway along Doolittle Drive and an unsignalized full access driveway along Hester Street. The Project site plan is presented in **Figure 2**.

This TIS was prepared to address the Project's VMT and LOS effects in order to assist the City of San Leandro ("City") with planning and the identification of conditions of approval and to mitigate the Project's VMT impacts or improve identified LOS deficiencies, if necessary. The following discusses the methodology, analysis, and results of the traffic assessment.

STUDY METHODOLOGY

VEHICLE MILES TRAVELED (VMT)

With the passage of SB 743, Vehicle Miles Traveled (VMT) has become an important indicator for determining if a new development will result in a "significant transportation impact" under the California Environmental Quality Act (CEQA). This report summarizes the VMT analysis and resultant findings for the proposed development.

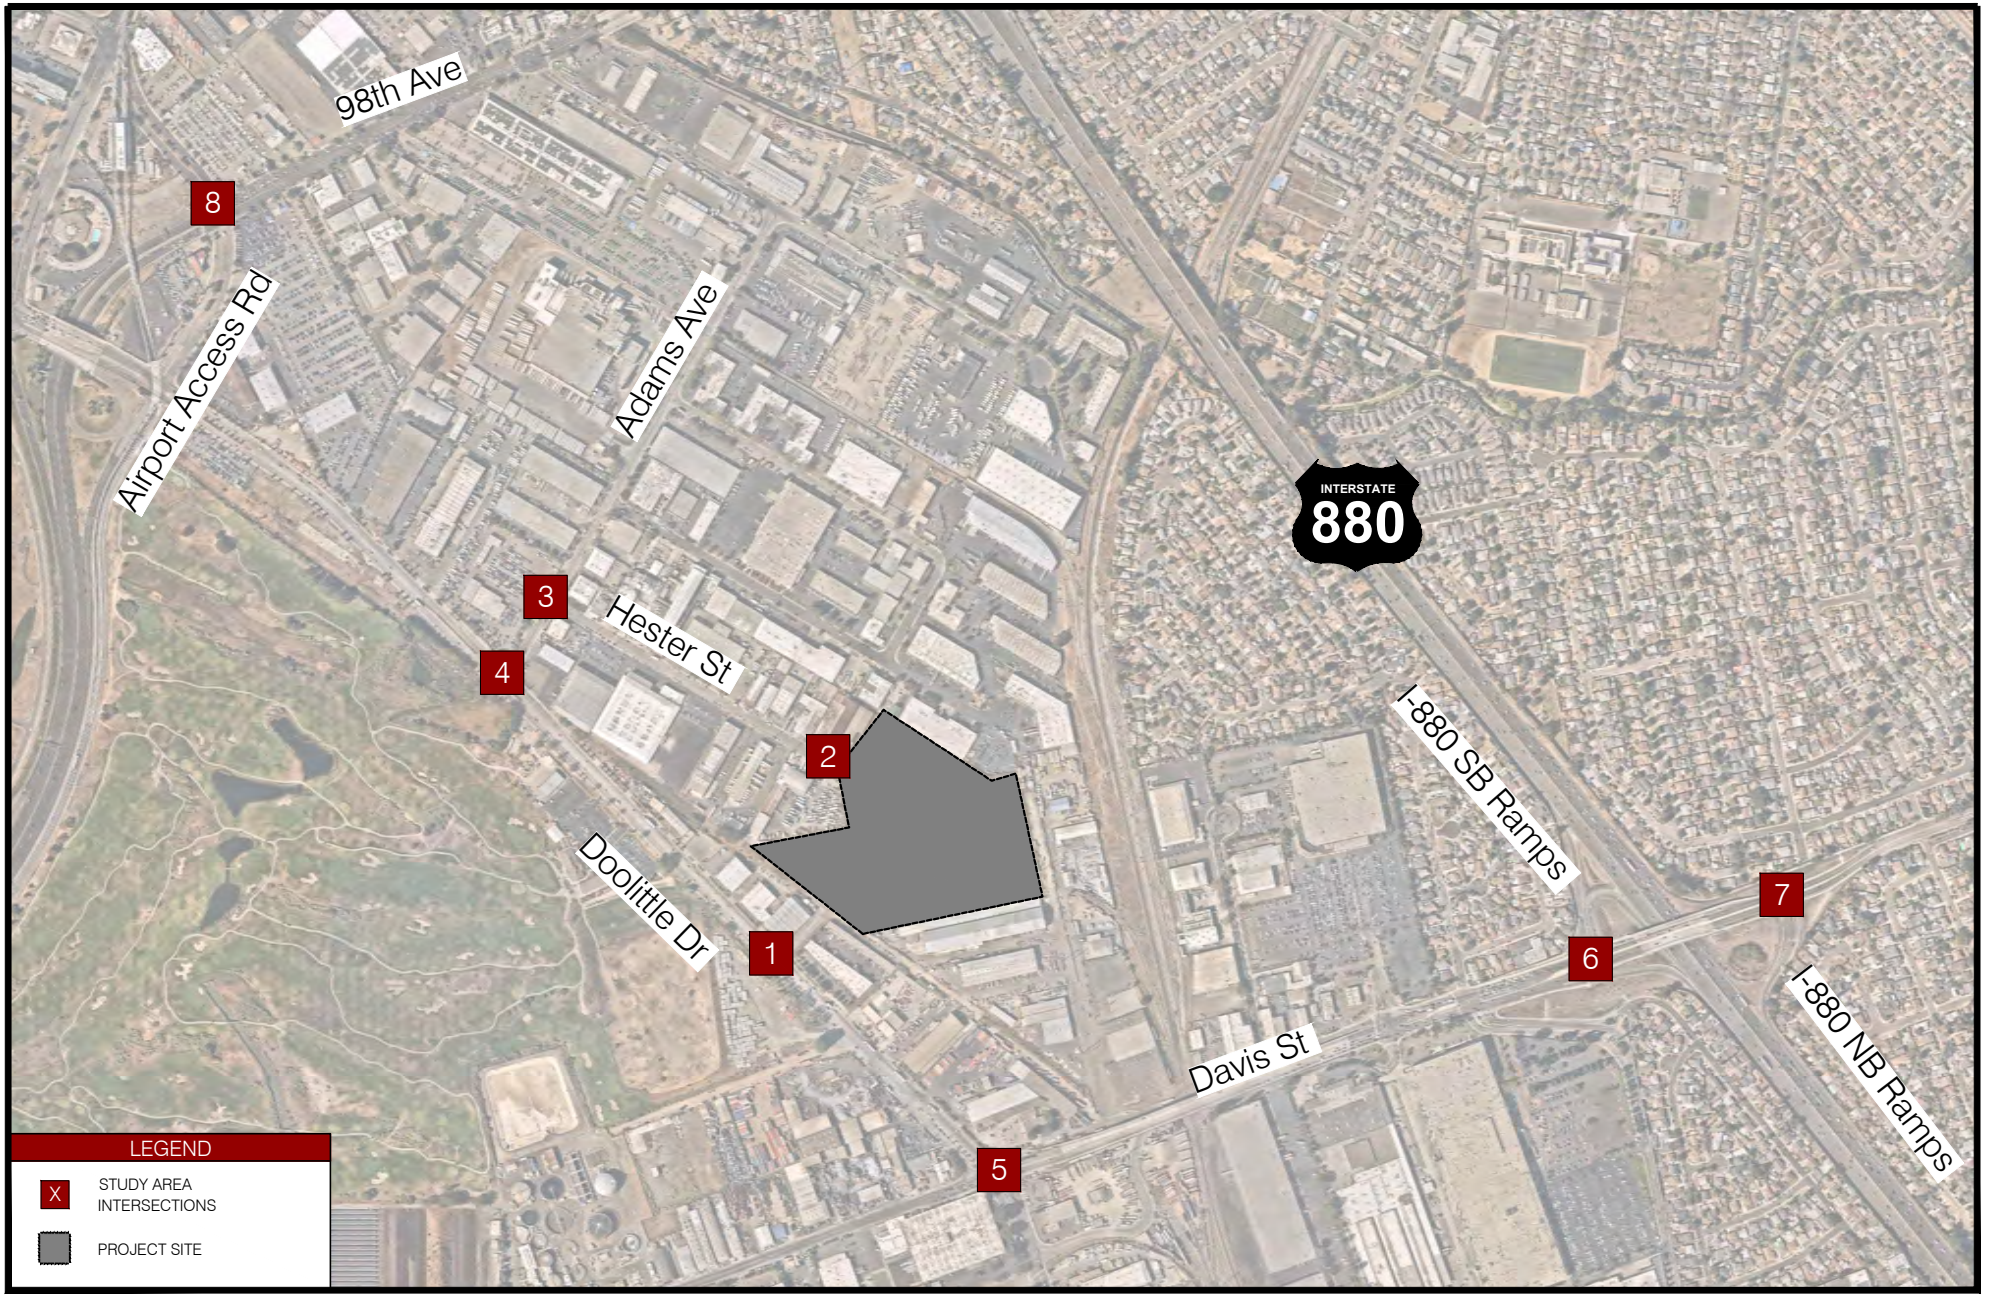
The Alameda County Transportation Commission (ACTC) was developed to implement transportation programs and project across Alameda County. One of its responsibilities is to develop and manage the Countywide travel demand model, which is used for estimating future volumes and VMT based on future land uses and the future roadway network. ACTC has developed maps displaying estimates of VMT per employee based on traffic analysis zone (TAZ) estimates from the Alameda Countywide Travel Demand Model that were used to determine if the project would cause a significant impact.

The City does not have a specified VMT criteria, and therefore per guidance provided by the Governor's Office of Planning and Research (OPR) *Technical Advisory on Evaluating Transportation Impacts in CEQA*, the threshold for employment-based VMT uses is set at 15 percent below the regional average.

TRAFFIC OPERATIONS ANALYSIS

A transportation impact analysis was conducted to evaluate the Project's effect on LOS operations at eight (8) intersections within the project site and adjacent to the project site.

Study Area



The proposed project will generate new vehicular trips that may increase traffic volumes on the nearby street network. To assess changes in traffic conditions associated with the proposed project, the following intersections listed below were evaluated and are shown in **Figure 1**. The study intersections were selected based on the estimated vehicle trips generated by the project and the distribution of the trips to the roadway network.

1. Doolittle Drive and West Project Driveway – Unsignalized
2. Hester Street and North Project Driveway – Unsignalized
3. Hester Street and Adams Avenue – Unsignalized
4. Doolittle Drive and Adams Avenue – Signalized
5. Doolittle Drive and Davis Street – Signalized
6. Davis Street and SB I-880 Ramps – Signalized
7. Davis Street and NB I-880 Ramps – Signalized
8. Airport Access Road and 98th Avenue – Signalized

Analysis Scenarios

This traffic analysis evaluated the following five (5) scenarios:

- Existing Conditions – Based on Existing (2020) traffic counts from the *880 Doolittle Traffic Analysis* prepared by Urban Crossroads in October 2021 shown in **Appendix A**, and existing roadway geometry and traffic control in 2022. Existing (2020) counts were adjusted to the current Existing year (2022) by increasing the volumes by 0.772 percent per year (compounded annually). Trips from the existing site were removed to reflect the vacancy in 2023 conditions. This annual growth rate used in the Urban Crossroads study is based on the average Association of Bay Area Governments (ABAG) projected growth for employment, population, and households for San Leandro.
- Near Term Conditions – Based on adjusted existing traffic volumes, ambient growth along major roadways, and traffic generated by approved developments in the study area. This scenario is based on the roadway geometry and traffic control assumed for year 2024.
- Near Term Plus Project Conditions – Based on traffic generated by the proposed project added to Near Term traffic volumes. This scenario is based on the roadway geometry and traffic control assumed for year 2024.
- Cumulative Conditions – Based on future year traffic forecasts from the Alameda County Transportation Commission (ACTC) travel demand model. This scenario is based on the roadway geometry and traffic control assumed for year 2040.
- Cumulative Plus Project Conditions – Based on traffic generated by the proposed project added to Cumulative traffic volumes. This scenario is based on the roadway geometry and traffic control assumed for year 2040.

Level of Service Standards

Analysis of the study intersections were based on the concept of Level of Service (LOS) and is a qualitative measure used to describe operational conditions. LOS ranges from A (best), which represents minimal delay, to F (worst), which represents heavy delay and a facility that is operating at or near its functional capacity. Levels of service for this study were determined using methods defined in the *Highway Capacity Manual, 6th Edition* (HCM 6) and *Highway Capacity Manual, 2000* (HCM 2000) within Synchro analysis software. Intersections with standard signal phasing were analyzed with HCM 6. Intersections with non-standard signal phasing or non-standard intersection control were analyzed using HCM 2000 methodologies due to HCM 6 methodology limitations within Synchro. This analysis was prepared based on the standards and methodologies set forth by the City of San Leandro (City).

It should be noted that recent changes to the California Environmental Quality Act (CEQA) now recognizes vehicle miles traveled (VMT) as the primary standard of review for project impacts and is no longer based on intersection delay and LOS. Therefore, the LOS evaluation is provided for informational purposes only and to document the operational changes as a result of the project. The VMT evaluation has been provided in Chapter 4.

The HCM includes procedures for analyzing side street stop controlled (SSSC) and signalized intersections. The SSSC procedure defines LOS as a function of average control delay for the worst approach. Conversely, the signalized intersection procedures define LOS as a function of average control delay for the intersection as a whole. **Table 1** relates the operational characteristics associated with each LOS category for signalized and unsignalized intersections.

Table 1 – Intersection Level of Service Definitions

Level of Service	Description	Signalized (Avg. control delay per vehicle sec/veh.)	Unsignalized (Avg. control delay per vehicle sec/veh.)
A	Free flow with no delays. Users are virtually unaffected by others in the traffic stream	≤ 10	≤ 10
B	Stable traffic. Traffic flows smoothly with few delays.	> 10 – 20	> 10 – 15
C	Stable flow but the operation of individual users becomes affected by other vehicles. Modest delays.	> 20 – 35	> 15 – 25
D	Approaching unstable flow. Operation of individual users becomes significantly affected by other vehicles. Delays may be more than one cycle during peak hours.	> 35 – 55	> 25 – 35
E	Unstable flow with operating conditions at or near the capacity level. Long delays and vehicle queuing.	> 55 – 80	> 35 – 50
F	Forced or breakdown flow that causes reduced capacity. Stop and go traffic conditions. Excessive long delays and vehicle queuing.	> 80	> 50

Sources: Transportation Research Board, Highway Capacity Manual 6th Edition, National Research Council, 2016.

The LOS standards as outlined in the City of San Leandro General Plan[1] is LOS D. The City does not have a written significant impact criteria. Based on the *880 Doolittle Traffic Analysis* by Urban Crossroads, dated October 2021, a project would create a deficiency under the following conditions:

- When a study intersection operates at an acceptable LOS for without project conditions and the addition of project trips causes the intersection to operate at an unacceptable LOS.
- When a study intersection operates at an unacceptable LOS for without project conditions and the addition of project trips causes the intersection volume-over-capacity ratio (v/c) to increase by 0.05 or more.

Queuing

The effects of vehicle queuing were analyzed and the 95th percentile queue is reported for all study intersections. The 95th percentile queue length represents a condition where 95 percent of the time during the peak hour, traffic queues will be less than or equal to the queue length determined by the analysis. This is referred to as the "95th percentile queue." Average queuing is generally less.

Queues that exceed the turn pocket length can create potentially hazardous conditions by blocking through traffic in adjacent travel lanes. The City does not have standards for queuing. For the purpose of this analysis, queuing deficiencies would be considered as operational issues and were considered to occur under conditions where project traffic causes the queue to extend beyond the turn pocket by 25 feet or more (i.e., the length of one vehicle) into adjacent traffic lanes that operate separately from the left or right turn lane. Where the vehicle queue already exceeds that turn pocket length under pre-project conditions, a queuing deficiency would occur if project traffic lengthened the queue by 25 feet or more.

REPORT ORGANIZATION

The remainder of the report is divided into the following chapters:

- Chapter 2: Existing Conditions – describes existing conditions on the roadway network.
- Chapter 3: Project Description – describes the project including project trip generation, distribution, and assignment.
- Chapter 4: Vehicles Miles Traveled – describes the Project's Vehicle Miles Traveled (VMT) methodology, analysis, and results.
- Chapter 5: Traffic Operations Analysis – describes intersection level of service analysis, roadway level of service, and intersection queuing.
- Chapter 6: Alameda County Transportation Commission Land Use Analysis Program – describes results of the Alameda CTC Land Use analysis under Year 2020 and Year 2040 Conditions.
- Chapter 7: Site Access and Circulation – describes site access and circulation and parking for the site. This chapters also includes potential effects the proposed project may have on the transit system, pedestrian facilities, and bicycle facilities.
- Chapter 8: Parking – describes the vehicle and bicycle parking for the proposed project, as well as required parking.
- Chapter 9: Conclusion – summarizes potential deficiencies and improvements of the proposed project, if necessary.

2. EXISTING CONDITIONS

This chapter describes the existing conditions of the roadway network within the vicinity of the project site. The chapter also presents existing turning movement volumes and intersection levels of service.

EXISTING ROADWAY NETWORK

INTERSTATE 880 (I-880)

Interstate 880 (I-880) is a north-south freeway that connects to Interstate 280 and State Route 17 to the south to Interstate 80 and Interstate 580 to the north. Within the study area, the roadway consists of six southbound lanes (including one HOV lane) and four northbound lanes. I-880 serves as regional access to the project site. The posted speed limit on I-880 within the study area is 65 mph.

DOOLITTLE DRIVE

Doolittle Drive is a north-south arterial. It connects to Otis Drive and Fernside Boulevard to the north and Belvedere Avenue to the south. The roadway within the study area is two lanes in each direction and has a center two-way left-turn lane (TWLTL). It serves mainly industrial uses along the corridor. Within the study area, the speed limit on Doolittle Drive is 45 miles per hour.

DAVIS STREET

Davis Street is a four-lane, east-west arterial which runs between Business Center Drive and E 14th Street. The roadway serves residential and commercial uses. Within the study area, the speed limit on Davis Street is 35 miles per hour.

ADAMS AVENUE

Adams Avenue is a two-lane, east-west collector between Doolittle Drive and Bigge Street. The roadway includes Class II bike lanes and on-street parking and serves industrial uses. Within the study area, the speed limit on Adams Avenue is 35 miles per hour.

HESTER STREET

Hester Street is a two-lane, north-south local road connecting to Adams Avenue. The roadway includes on-street parking and serves industrial uses. Within the study area, there is no posted speed limit but given the classification of the road, it is assumed that the speed limit is 25 miles per hour.

AIRPORT ACCESS ROAD

Airport Access Road is a five-lane, minor collector that connects to Bessie Coleman Drive and Hegenberger Road. The roadway provides access to the Oakland International Airport. Within the study area, there is no posted speed limit but given the classification of the road, it is assumed that the speed limit is 35 miles per hour.

98TH AVENUE

98th Avenue is a minor arterial which connects to Bessie Coleman Drive to the west and Golf Links Road to the east. The roadway within the study area consists of six-lanes and serves multiple uses. Within the study area, the posted speed limit is 30 miles per hour.

EXISTING LANE CONFIGURATION AND TRAFFIC CONTROL

Existing intersection lane configuration and traffic controls are illustrated in **Figure 3**.

EXISTING PEAK-HOUR TURNING MOVEMENT VOLUMES

Volumes are based on Existing (2020) traffic counts from the *880 Doolittle Traffic Analysis*[2] prepared by Urban Crossroads in October 2021, and existing roadway geometry and traffic control in 2022. Existing (2020) counts were adjusted to the current Existing year (2022) by growing the volumes by 0.772 percent per year (compounded annually). Trips from the existing site were removed to reflect the vacancy in 2023 conditions. This annual growth rate used in the Urban Crossroads study is based on the average ABAG projected growth for employment, population, and households for San Leandro. Existing peak hour turning movement volumes are shown in **Figure 4.**

3. PROJECT DESCRIPTION

This chapter presents a description of the proposed site use, trip generation, trip distribution, and trip assignment for the proposed project on the transportation system.

PROPOSED SITE USE

The project proposes to redevelop the existing building to become a warehousing and distribution spec building totaling 239,573 square feet. The existing building has been vacant since 2020 (after the counts were taken) and was not occupied during Existing (2023) conditions. Therefore, no existing trip credits were taken.

Figure 1 illustrates the location of the project site in relation to the adjacent roadway network. The site would be accessed by an unsignalized full access driveway along Doolittle Drive and an unsignalized full access driveway along Hester Street. The Project site plan is presented in **Figure 2**.

TRIP GENERATION

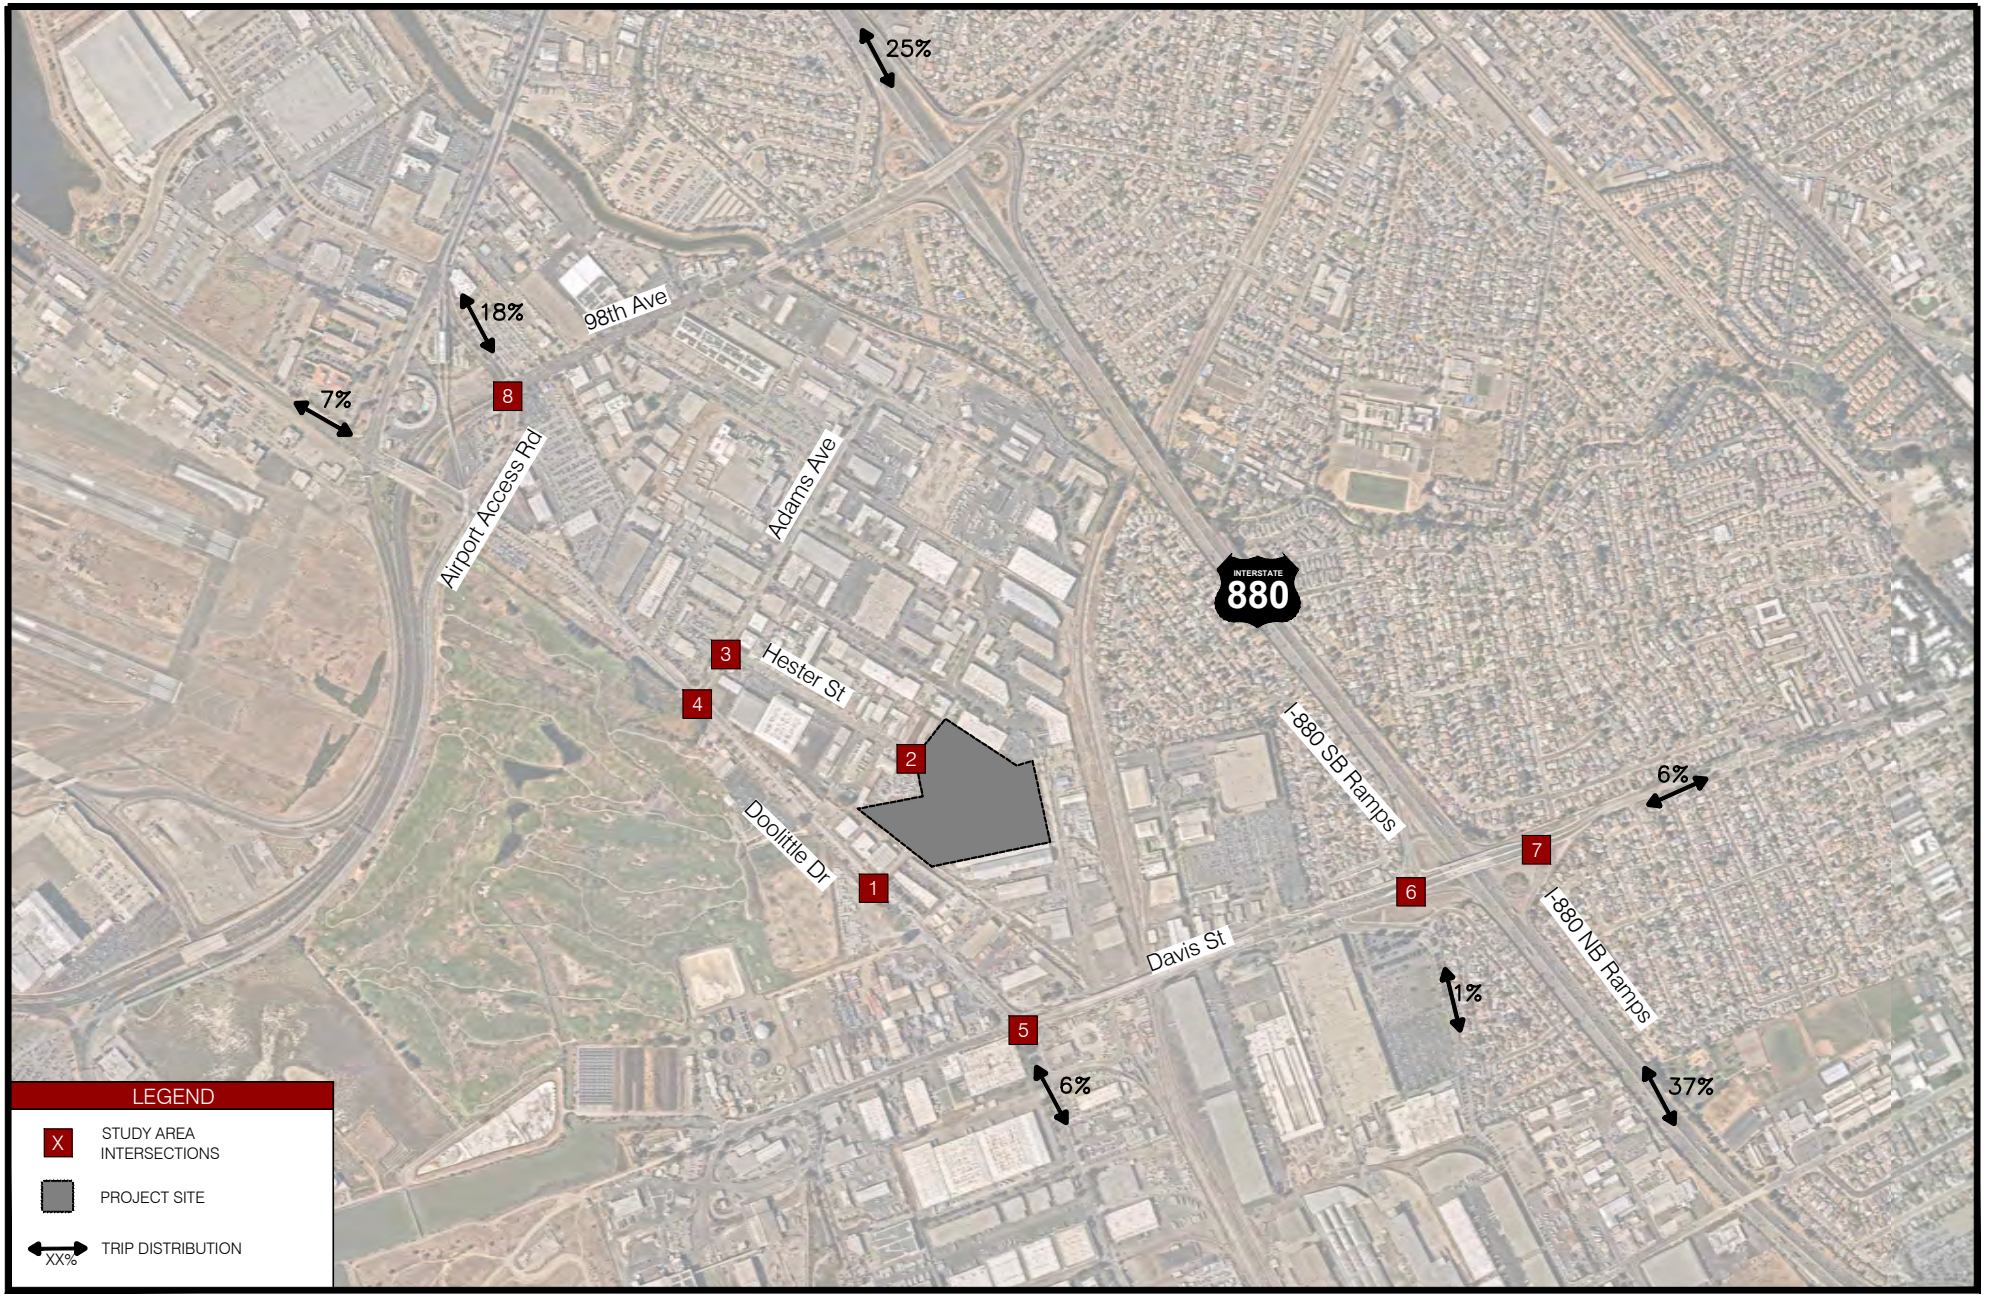
Trip generation for projects are typically calculated based on information contained in the Institute of Transportation Engineer's (ITE) publication, *Trip Generation Manual, 11th Edition*[3]*.* The manual is a standard reference used by jurisdictions throughout the country for the estimation of trip generation of proposed projects. A trip is defined in the *Trip Generation Manual* as a single or one-directional vehicle movement with either the origin or destination at the project site. In other words, a trip can be either "to" or "from" the site and therefore, a single visitor to a site is counted as two.

For purposes of determining the worst-case deficiencies of traffic on the surrounding street network, the trips generated by a proposed project are estimated for the AM peak hour (between the hours of 7:00 AM and 9:00 AM), and for the PM peak hour (between 4:00 PM and 6:00 PM) on a typical weekday. Trips generated by the proposed project were based on the rates for ITE Land Use 155 (High-Cube Fulfillment Center – Sort).

Table 2 presents the trip generation for the proposed project. The project would generate 208 trips in the AM peak hour and 287 trips in the PM peak hour.

[3] *Trip Generation Manual, 11th Edition*, Institute of Transportation Engineers, 2021.

Table 2 – Project Trip Generation



Vehicle Type	Daily	AM Peak Hour (7:00-9:00)			PM Peak Hour (4:00-6:00)		
		In	Out	Total	In	Out	Total
100% ITE (LU 155 Sort) High-Cube Fulfillment Center[2]							
Rates							
Passenger Car	6.25	0.69	0.16	0.85	0.46	0.72	1.18
Truck	0.19	0.01	0.01	0.02	0.01	0.01	0.02
Trips							
Passenger Car	1,497	167	36	203	110	172	282
Truck	46	2	3	5	2	3	5
Total	1,543	169	39	208	112	175	287

[1] Existing trip generation is based on the 880 Doolittle Traffic Analysis prepared by Urban Crossroads in October 2021.
[2] Proposed trip generation based on ITE *Trip Generation Manual, 11th Edition*.

PROJECT TRIP DISTRIBUTION AND ASSIGNMENT

The Project's trip distribution was estimated based on the project access locations, freeway access, and roadway network within the study area. **Figure 5** presents the trip distribution assumed for the Near Term Plus Project and Cumulative Plus Project analysis.

Based on the assumed trip distribution, the volumes generated by the project were assigned to the roadway network. Trip assignment to the project driveways was based on the on-site circulation and available movements for each driveway. **Figure 6** presents the project's AM and PM peak hour trip assignment.

4. VEHICLE MILES TRAVELED (VMT)

This chapter summarizes the Project's Vehicle Miles Traveled (VMT) methodology, analysis, and results.

VMT METHODOLOGY

The City has not yet adopted VMT guidelines or a methodology for determining VMT impacts. Therefore, the Project's VMT evaluation relied on guidance provided by the Governor's Office of Planning and Research (OPR) Technical Advisory on Evaluating Transportation Impacts in CEQA[4] to determine potential impacts under Senate Bill (SB) 743. It should be noted that the ACTC VMT tools and maps are consistent with OPR methodology and the recommended 15 percent below regional average threshold. The approach outlined by the OPR Technical Advisory does not specifically address industrial facilities. However, for the purposes of this analysis, it is assumed that the employee VMT for this Project would have a similar VMT as an employee for an office use. Therefore, the Project was analyzed as an office project, which is evaluated based on VMT per employee since the predominant driver of VMT for the proposed Project would be commute trips and other employee-based trips. This approach is consistent with OPR guidelines which states, "where methodologies exist that can estimate the full extent of vehicle miles traveled from a project, the lead agency should apply them to do so".

VMT ANALYSIS

The ACTC has developed maps displaying estimates of VMT per employee based on traffic analysis zone (TAZ) estimates from the Alameda Countywide Travel Demand Model. Based on the VMT per Employee map for the Central Planning Area shown in **Appendix B**, the project is located in an area with a VMT equal to 15.34 in 2020 and 16.08 in 2040.

Based on the VMT per Employee map for the Central Planning Area in year 2020 provided by the ACTC, the project is located in an area with a VMT equal to 15.34. The target VMT, which is 15 percent below the average, for Central Planning Area is 16.3. Since the proposed project VMT does not exceeds the Central Planning Area threshold, the project will result in a less than significant VMT impact.

Based on the VMT per Employee table for the Central Planning Area in year 2040 provided by the ACTC, the project is located in an area with a VMT equal to 16.08. The target VMT, which is 15 percent below the average, for Central Planning Area is 16.2. Since the proposed project VMT does not exceeds the Central Planning Area threshold, the project will result in a less than significant VMT impact.

Table 3 summarizes the VMT analysis.

[4] Technical Advisory on Evaluating Transportation Impacts in CEQA, Governor's Office of Planning and Research, December 2018.

Table 3 – VMT Analysis Summary

Category	2020	2040
	Central Planning Area	Central Planning Area
Average VMT per Employee	19.2	19.1
Threshold VMT per Employee (85% of Average)	16.3	16.2
Project TAZ Average VMT per Employee	15.34	16.08
VMT Reduction Percentage Needed	0%	0%

5. TRAFFIC OPERATIONS ANALYSIS

This chapter will discuss the traffic operations analysis that was conducted to determine the effect of the proposed project on the transportation system. The operations analysis includes intersection level of service and intersection queuing.

EXISTING CONDITIONS

Existing conditions represent operations based on the existing roadway configuration (**Figure 3**) and existing volumes (**Figure 4**).

INTERSECTION LEVEL OF SERVICE

Traffic operations were evaluated at the study intersections under existing traffic conditions. Results of the analysis are presented in **Table 4**. All study intersections function within acceptable LOS standards under this analysis scenario except for Intersection #5 – Doolittle Drive and Davis Street in the AM peak hour.

Table 4 – Existing Peak Hour LOS Summary

#	Intersection	LOS Criteria	Jurisdiction	Control[1]	Existing					
					AM Peak			PM Peak		
					LOS	Delay[2] (sec)	v/c	LOS	Delay[2] (sec)	v/c

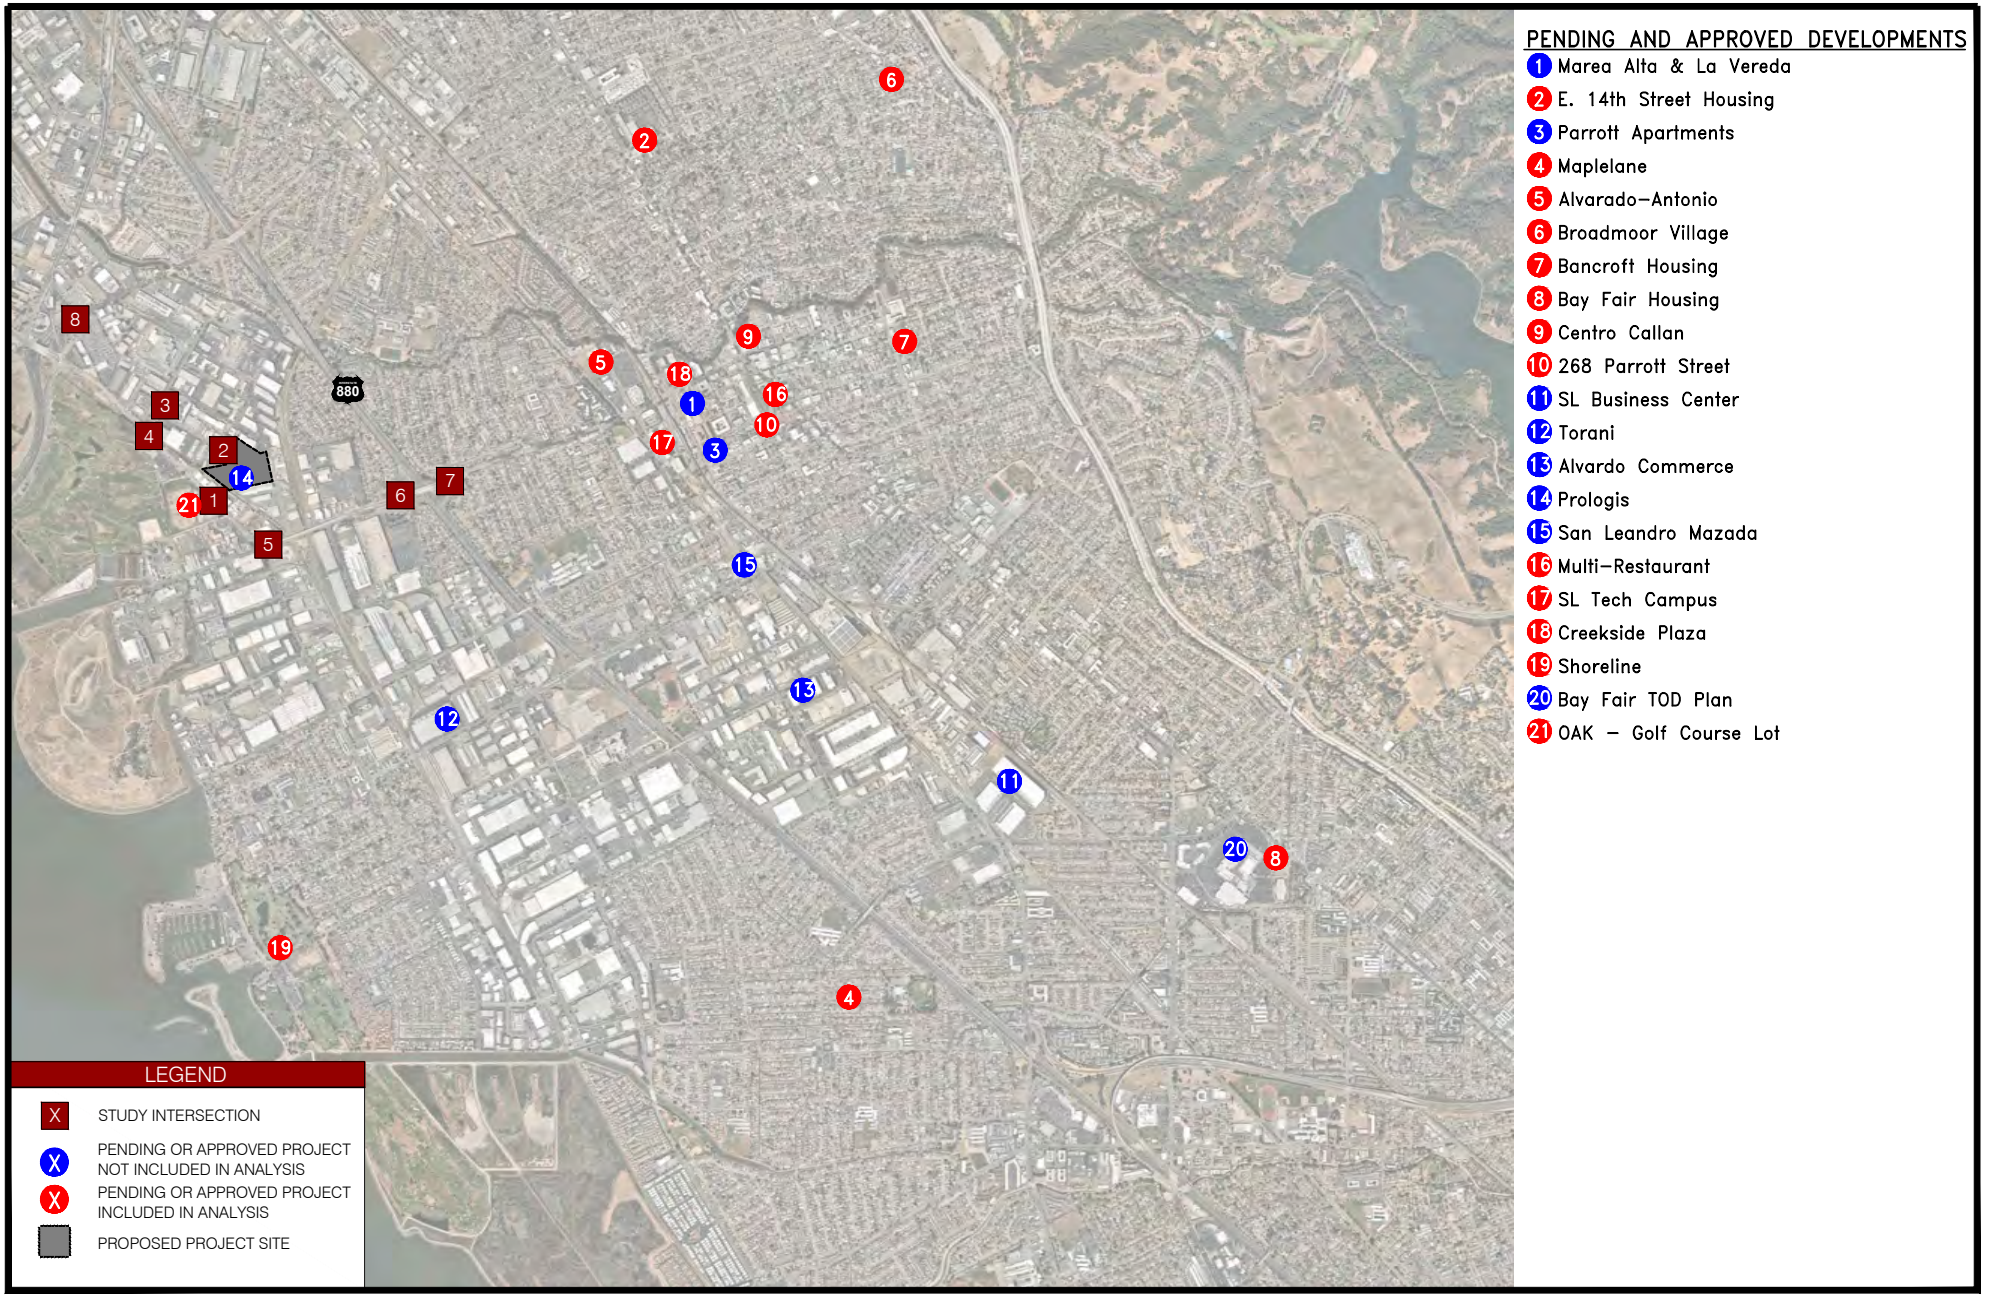
3 Analyzed using HCM 2000 due to non-NEMA phasing.
4 Analyzed using HCM 2000 due to errors with HCM 6 within Synchro 11.

Analysis sheets are provided in **Appendix C**.

NEAR TERM TRAFFIC CONDITIONS

LANE GEOMETRY

Under Near Term conditions, no roadway improvements were assumed, therefore existing lane geometry was assumed as shown in **Figure 3**.



TRAFFIC VOLUMES

At the time of the analysis (November 2022), the San Leandro Developments map and table was downloaded from the City's website and used to determine which projects would be included in the Near Term Conditions. Projects within the vicinity of the project site that were proposed or approved were assumed to be generating vehicle traffic under Near Term Conditions. All pending and approved projects were considered; however, only the projects that would generate a substantial number of trips and were located close enough to affect the study area were included in the analysis. **Figure 7** lists the projects that were included in the Near Term traffic and shows the location of all approved and pending projects. Locations shown in red were included in the analysis and locations shown in blue were considered but not included in the analysis. Specifically, the Oakland Airport Golf Course Parking Lot project was included. Volumes along major arterials such as Doolittle Drive and 98th Avenue were also grown by 0.772 percent per year (compounded annually) to account for trips generated by future developments outside of San Leandro. Pending and approved project volumes are shown in **Figure 8**.

INTERSECTION LEVEL OF SERVICE

Near Term volumes were evaluated at the study intersections and are presented in **Figure 9**. Results are presented in **Table 5**. All study intersections function within acceptable LOS standards under this analysis scenario except for Intersection #5 – Doolittle Drive and Davis Street.

Analysis sheets are provided in **Appendix C**.

NEAR TERM PLUS PROJECT

LANE GEOMETRY AND CONTROL

The project is not proposing any roadway improvements at any study intersection and therefore Near Term Plus Project conditions assumed existing lane geometry as illustrated in **Figure 3**.

TRAFFIC VOLUMES

The Project is estimated to generate a net 497 daily trips, a total of 49 AM peak hour trips (89 inbound and -40 outbound), and 152 PM peak hour trips (55 inbound and 97 outbound). Near Term Plus Project volumes were determined by adding the total project traffic, **Figure 6**, to the Near Term conditions volume, **Figure 9**. Near Term Plus Project peak hour volumes are shown in **Figure 10**.

INTERSECTION LEVEL OF SERVICE

Near Term Plus Project traffic conditions were evaluated at the study intersections. Results are presented in **Table 5**. All study intersections function within acceptable LOS standards under this analysis scenario during the AM and PM peak hours except for Intersection #5 – Doolittle Drive and Davis Street. In the AM peak hour, this intersection deficiency is considered a project deficiency because it operates at an unacceptable LOS for without project conditions and the addition of project trips causes the intersection v/c to increase by 0.05 or more.

Analysis sheets are provided in **Appendix C**.

N

NOT TO SCALE

Kimley»Horn

FIGURE 10
NEAR TERM PLUS PROJECT PEAK HOUR TURNING MOVEMENT VOLUMES

CUMULATIVE TRAFFIC CONDITIONS

LANE GEOMETRY

Under Cumulative conditions, no roadway improvements were assumed, therefore existing lane geometry was assumed as shown in **Figure 3**.

TRAFFIC VOLUMES

To account for future development and growth within the County, the Cumulative traffic volumes were developed by determining a growth rate from the ACTC Model. Existing and future year model outputs were acquired for the roadway links in the study area. These link volumes were then used to determine an annual growth rate that was applied to the Existing volumes. The volumes were reviewed to ensure that there would be no decrease in volumes from Existing or Near Term to the Cumulative year. For locations where the volumes would decrease, they were conservatively assumed to equal the Near Term volume and rounded up to the nearest 10 vehicles. Cumulative peak hour volumes are presented in **Figure 11.**

INTERSECTION LEVEL OF SERVICE

Cumulative volumes were evaluated at the study intersections. Results are presented in **Table 6**. All study intersections function within acceptable LOS standards under this analysis scenario except for Intersection #5 – Doolittle Drive and Davis Street and Intersection #8 – Airport Access Road and 98th Avenue.

Analysis sheets are provided in **Appendix C.**

CUMULATIVE PLUS PROJECT

LANE GEOMETRY AND CONTROL

The project is not proposing any roadway improvements at any study intersection and therefore Cumulative Plus Project conditions assumed existing lane geometry as illustrated in **Figure 3**.

TRAFFIC VOLUMES

The Project is estimated to generate a net 497 daily trips, a total of 49 AM peak hour trips (89 inbound and -40 outbound), and 152 PM peak hour trips (55 inbound and 97 outbound). Cumulative Plus Project volumes were determined by adding the total project traffic, **Figure 6**, to the Cumulative conditions volume, **Figure 11**. Cumulative Plus Project peak hour volumes are shown in **Figure 12**.

INTERSECTION LEVEL OF SERVICE

Cumulative Plus Project traffic conditions were evaluated at the study intersections. Results are presented in **Table 6**. Intersections operate unacceptably but are not considered a project deficiency if the intersection is operating unacceptably without the project and the increase in v/c is less than 0.05. Intersection #8 – Airport Access Road and 98th Avenue operates unacceptably in the AM and PM peak hours, but is not considered a project deficiency because the project increases the v/c by less than 0.05. Intersection #5 – Doolittle Drive and Davis Street operates unacceptably in the AM and PM peak hours and is considered a project deficiency in the AM peak hour because the project increases the v/c by more than 0.05.

Analysis sheets are provided in **Appendix C**.

VEHICLE QUEUING

As congestion increases, it is common for traffic at intersections to form lines of stopped (or queued) vehicles. Queue lengths were determined for turn lanes in which significant project trips are being added, and the distance that vehicles will back up approaching an intersection were estimated. Synchro software calculates the 95th percentile queues based on Synchro software methodology. The 95th percentile queue is used to account for fluctuations in traffic and represents a condition where 95 percent of the time during the peak period, traffic volumes will be less than or equal to the queue determined by the analysis. It is used as a benchmark for determining deficiencies as a standard transportation engineering practice. A typical vehicle length of 25 feet was used in the queuing analysis. The effect of vehicle queuing was analyzed by reporting the 95th percentile queues for turning movements where the project would add trips to existing or proposed turn pockets. Left-turn lane vehicle queuing that exceeds a turn pocket length can create potentially hazardous conditions by blocking or disrupting through traffic in adjacent travel lanes. An operational deficiency, and not a significant impact, was assumed to occur if the left turn queue increases by one or more vehicles and the vehicle queue exceeds the left turn pocket length.

All queue lengths are contained within the available storage and the project does not increase the queue by one or more vehicles, except for the following movements:

- Intersection #5 – Doolittle Drive and Davis Street
    - Westbound right-turn (AM peak hour in Near Term plus Project and Cumulative plus Project scenarios)

The analysis showed that the westbound right-turn queue at Doolittle Drive and Davis Street exceeds the storage bay length of 120 feet. In the Near Term plus Project scenario and Cumulative plus Project scenario, the project trips increased the westbound right-turn queue by 146 feet and 141 feet in the AM peak hour, respectively. However, since the westbound right-turn vehicles will go during the same signal phase as the westbound through vehicles, this is not considered a queuing deficiency. Therefore, although the westbound right-turn queue extends beyond the storage length, it is not expected to cause any safety issues and no improvement is necessary.

The vehicle queuing summary is shown in **Table 7**.

6. ALAMEDA COUNTY TRANSPORTATION COMMISSION LAND USE ANALYSIS PROGRAM

This chapter presents the results of the Alameda CTC Land Use analysis under Year 2020 and Year 2040 Conditions, with and without the Project, in the PM peak hour.

YEAR 2020 AND YEAR 2040 NO PROJECT CONDITIONS

The Alameda CTC Land Use analysis was performed to comply with its congestion management plan (CMP) Land Use Analysis Program. In the CMP, development projects generating more than 100 PM net new peak hour trips are analyzed to determine its impact on Metropolitan Transportation System (MTS) roadways. Since the ACTC Land Use Analysis Program's 100-trip criteria is in the PM peak hour and the project generates greater project trips in the PM peak hour than the AM peak hour, the analysis was evaluated in the PM peak hour only.

The Alameda CTC travel demand model for Year 2020 and Year 2040 was used to determine 2020 and 2040 traffic volumes in the PM peak hour along the MTS roadways of Doolittle Drive and Davis Street. Traffic volumes and the number of lanes in each direction were used to determine the segment v/c ratio. It is assumed that the capacity of the roadway segment is 800 vehicles per hour per lane (vphpl).

Based on the analysis, the following MTS roadway segments operate at an unacceptable LOS F in Year 2020 and 2040 Conditions during the PM peak hour:

Year 2020 Conditions

- Northbound Doolittle Drive from Davis Street to Adams Avenue
- Eastbound Davis Street from Doolittle Drive to I-880 SB Ramps

Year 2040 Conditions

- Northbound Doolittle Drive from Davis Street to Adams Avenue
- Southbound Doolittle Drive from Adams Avenue to Davis Street
- Eastbound Davis Street from Doolittle Drive to I-880 SB Ramps
- Westbound Davis Street from I-880 SB Ramps to Doolittle Drive

YEAR 2020 AND YEAR 2040 PLUS PROJECT CONDITIONS

Project trips during the PM peak hour were added to the roadway segments under Year 2020 and Year 2040 Conditions to determine the v/c ratio under Plus Project Conditions. Based on the analysis, the following roadway segments continue to operate at an unacceptable LOS F in Plus Project Conditions:

Year 2020 Plus Project Conditions

- Northbound Doolittle Drive from Davis Street to West Project Driveway
  - With the addition of the project trips, this results in an increase in v/c of more than 0.02 – **Project Deficiency**
- Northbound Doolittle Drive from Adams Avenue to West Project Driveway
  - With the addition of the project trips, this results in an increase in v/c of less than 0.02 – **Not a Deficiency**
- Eastbound Davis Street from Doolittle Drive to I-880 SB Ramps
  - With the addition of the project trips, this results in an increase in v/c of less than 0.02 – **Not a Deficiency**

Year 2040 Plus Project Conditions

- Northbound Doolittle Drive from Davis Street to West Project Driveway
    - With the addition of the project trips, this results in an increase in v/c of more than 0.02 – **Project Deficiency**
- Northbound Doolittle Drive from Adams Avenue to West Project Driveway
    - With the addition of the project trips, this results in an increase in v/c of less than 0.02 – **Not a Deficiency**
- Southbound Doolittle Drive from Adams Avenue to West Project Driveway
    - With the addition of the project trips, this results in an increase in v/c of less than 0.02 – **Not a Deficiency**
- Southbound Doolittle Drive from West Project Driveway to Davis Street
    - With the addition of the project trips, this results in an increase in v/c of more than 0.02 – **Project Deficiency**
- Eastbound Davis Street from Doolittle Drive to I-880 SB Ramps
    - With the addition of the project trips, this results in an increase in v/c of less than 0.02 – **Not a Deficiency**
- Westbound Davis Street from I-880 SB Ramps to Doolittle Drive
    - With the addition of the project trips, this results in an increase in v/c of more than 0.02 – **Project Deficiency**

Table 8 and **Table 9** summarize the roadway segment capacity analysis for Year 2020 and Year 2040, respectively.

Table 8 – Year 2020 ACTC Roadway Segment Analysis

Note: Segments that are operating below acceptable levels are shown in **BOLD**. Project caused deficiencies are shaded.

7. SITE ACCESS AND CIRCULATION

This section discusses site access, site circulation, pedestrian facilities, bicycle facilities, transit recommendations, and sight distance analysis for the project.

The following summarizes the project access locations:

- Doolittle Drive and West Project Driveway
  - Stop-controlled westbound movement for project driveway
  - Full access
- Hester Street and North Project Driveway
  - Stop-controlled eastbound and westbound movement for project driveway
  - Full access

Appendix C contains the queuing worksheets for the Project's driveways. These AM/PM peak hour worksheets are the results of the Cumulative Plus Project Conditions and show that the west and north project driveway throat depths are sufficient to accommodate the project outbound queues during the peak hours. For the west project driveway, the throat depth was measured as approximately 50 feet, which is the distance from Doolittle Drive to the internal drive aisle at 900 Doolittle Drive. As shown, the estimated outbound vehicle queue is less than 25 feet, which does not exceed the throat depth of 50 feet. However, it is possible that a truck with a vehicle length of more than 50 feet may temporarily block the drive aisle at 900 Doolittle Drive. In this case, vehicles may queue within the drive aisle; however, this should not result in vehicles queuing onto Doolittle Drive and therefore does not require any improvements. For the north project driveway, the throat depths were measured as approximately 50 feet for both the eastbound and westbound approach, which is the distance from Hester Street to the first parking space. As shown, the estimated outbound vehicle queue is less than 25 feet, which does not exceed the throat depth of 50 feet. Therefore, there are no anticipated conflicts or excessive queuing.

VEHICLE SITE CIRCULATION

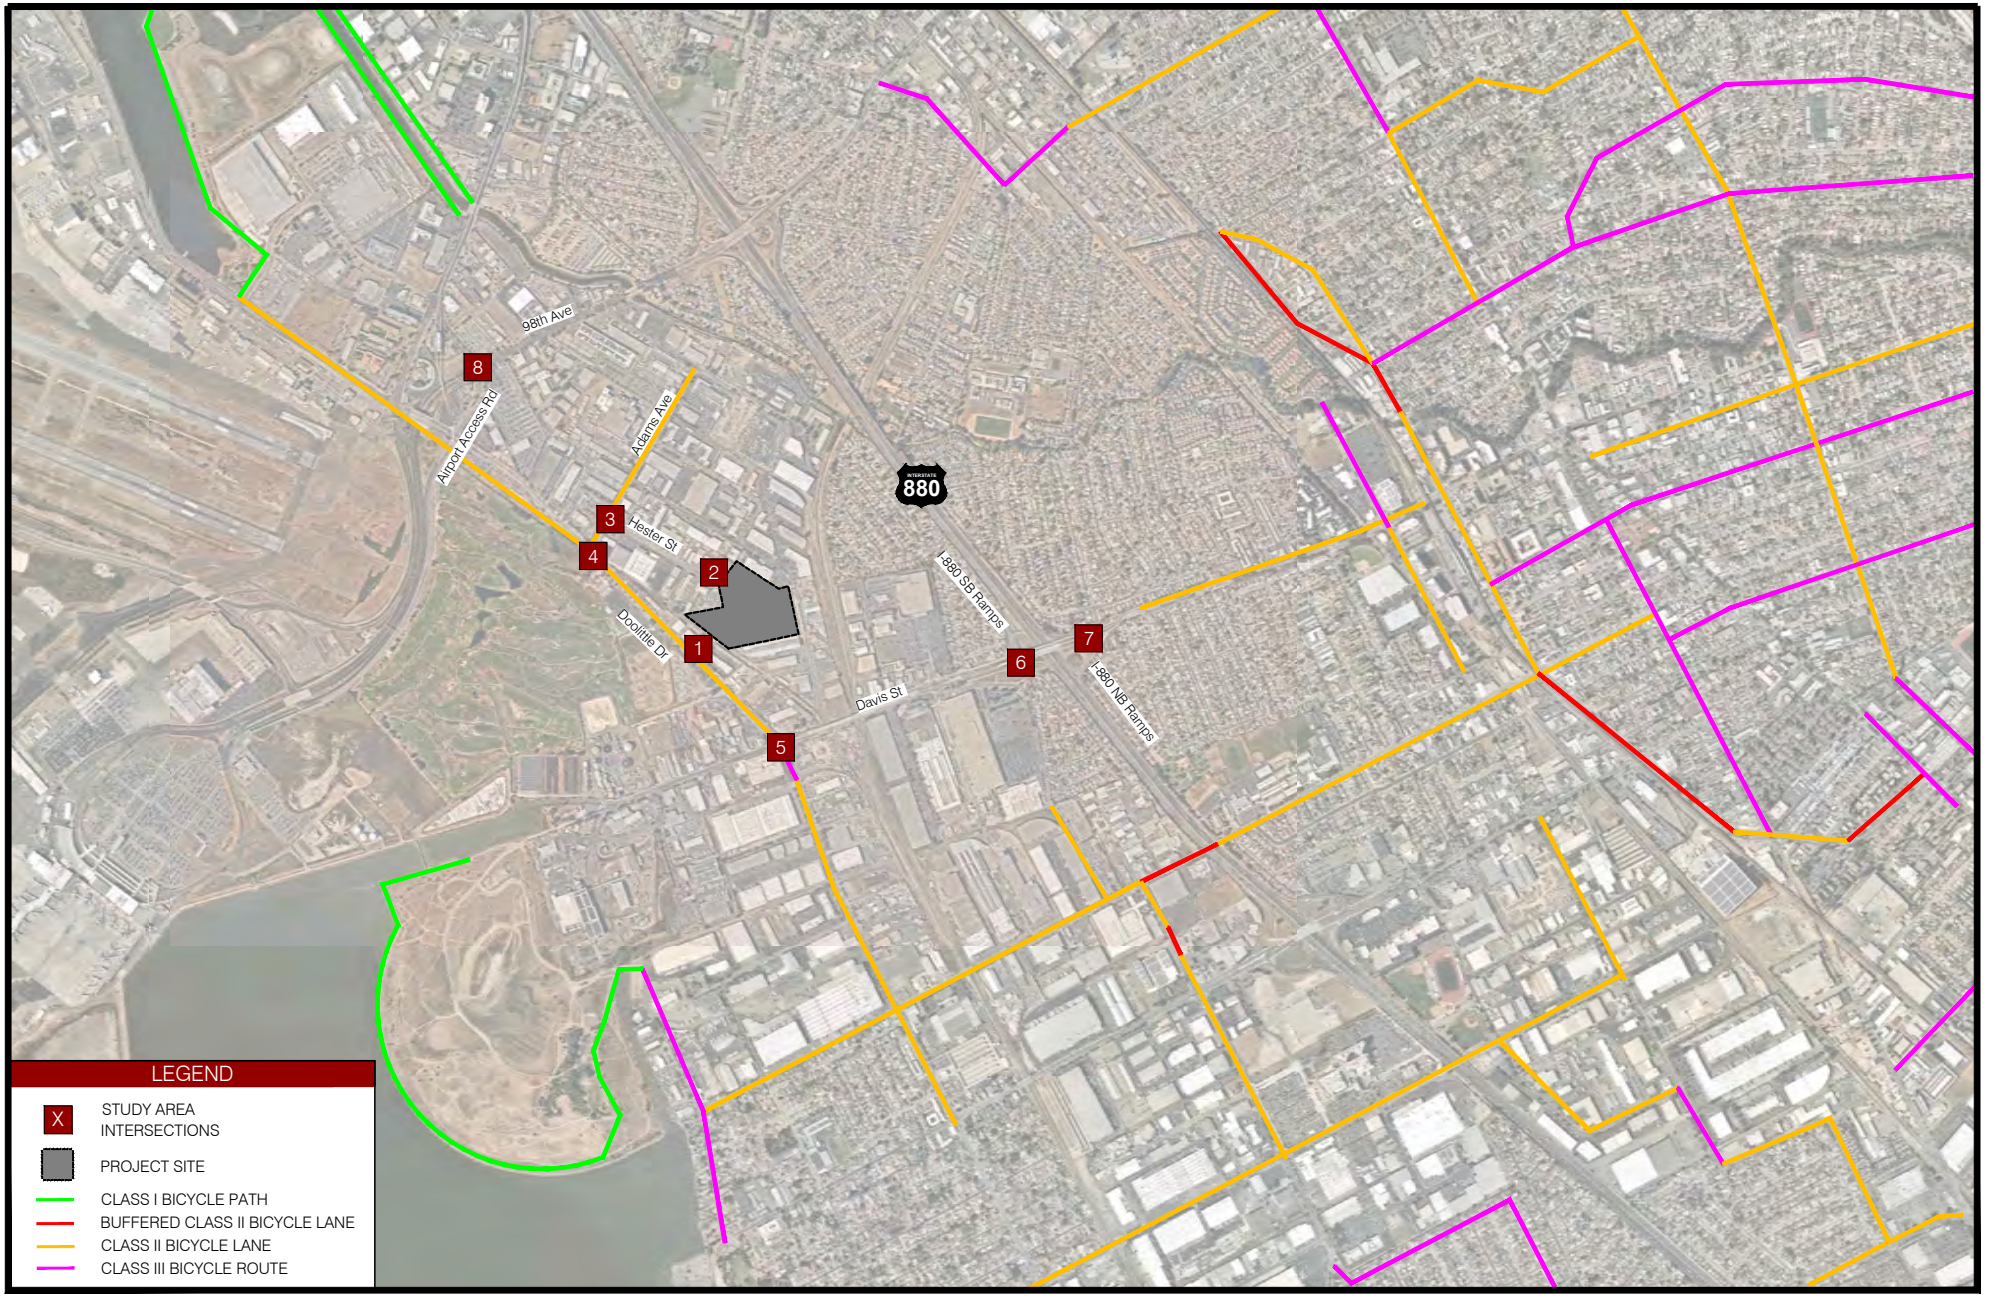
Passenger cars and trucks may use the West Project Driveway and North Project Driveway to enter the site. All truck parking is located on the north side of the site and the passenger car parking spaces are located to the west of the site. 24 dock doors are located on the north site of the building and 37 dock doors are located on the south side. Vehicles may use the drive aisles proposed on all sides of the building to access these parking spaces and docks.

PEDESTRIAN FACILITIES

There are existing continuous sidewalks on both sides of Doolittle Drive adjacent to the project site where pedestrians can access the site, as well as existing continuous sidewalks on both sides of Adams Avenue and on the east side of Hester Street. There are also existing crosswalks along the east, south, and west legs at the signalized intersection of Doolittle Drive and Davis Street, and existing crosswalks on the east and south legs at the signalized intersection of Doolittle Drive and Adams Street.

Within the project site, there are marked pedestrian crosswalks connecting the accessible parking spaces to the sidewalks along the west side of the building. These sidewalks along the west side of the building provide access to the office spaces. There are sufficient pedestrian facilities adjacent to the project and to nearby complimentary uses.

BICYCLE FACILITIES



Bicycles will have access to the project site using the Class II bicycle lanes along Doolittle Drive and Adams Avenue. Existing bicycle facilities are shown in **Figure 13**.

Within the project site, bicycle parking will be provided on the ground level. The project provides 12 short-term and 12 long-term bicycle parking spaces, which meets the City's requirements. Since there are sufficient bicycle facilities adjacent to the project, to nearby complimentary uses, and within the project site, no additional bicycle facilities are recommended to be constructed by the project.

TRANSIT

For those taking transit, Alameda-Contra Costa Transit District (AC Transit) bus routes 34, 35, 73, 98, 805 operate within the study area. The nearest bus stop is located at the intersection of Westgate Parkway and Davis Street, which is approximately 0.9 miles southeast of the project site. The San Leandro BART station, which serves the Blue, Green, and Orange BART lines, is located within 2.1 miles east of the project site. The San Leandro LINKS shuttle is a free shuttle to and from the San Leandro BART station that operates a North Loop and South Loop. The North Loop runs along Davis Street from the BART station to Marina Boulevard, Merced Street, Williams Street, Doolittle Drive, and Davis Street. There is an existing stop located at Doolittle Drive and Davis Street. Pedestrians can travel between the LINKS bus stop and the project site using the existing sidewalks located along both sides of Davis Street. Existing transit facilities are shown in **Figure 14**.

Since the LINKS route serves as a sufficient transit facility in proximity to the project along Davis Street to nearby complimentary uses, no additional transit facilities are recommended to be constructed by the project.

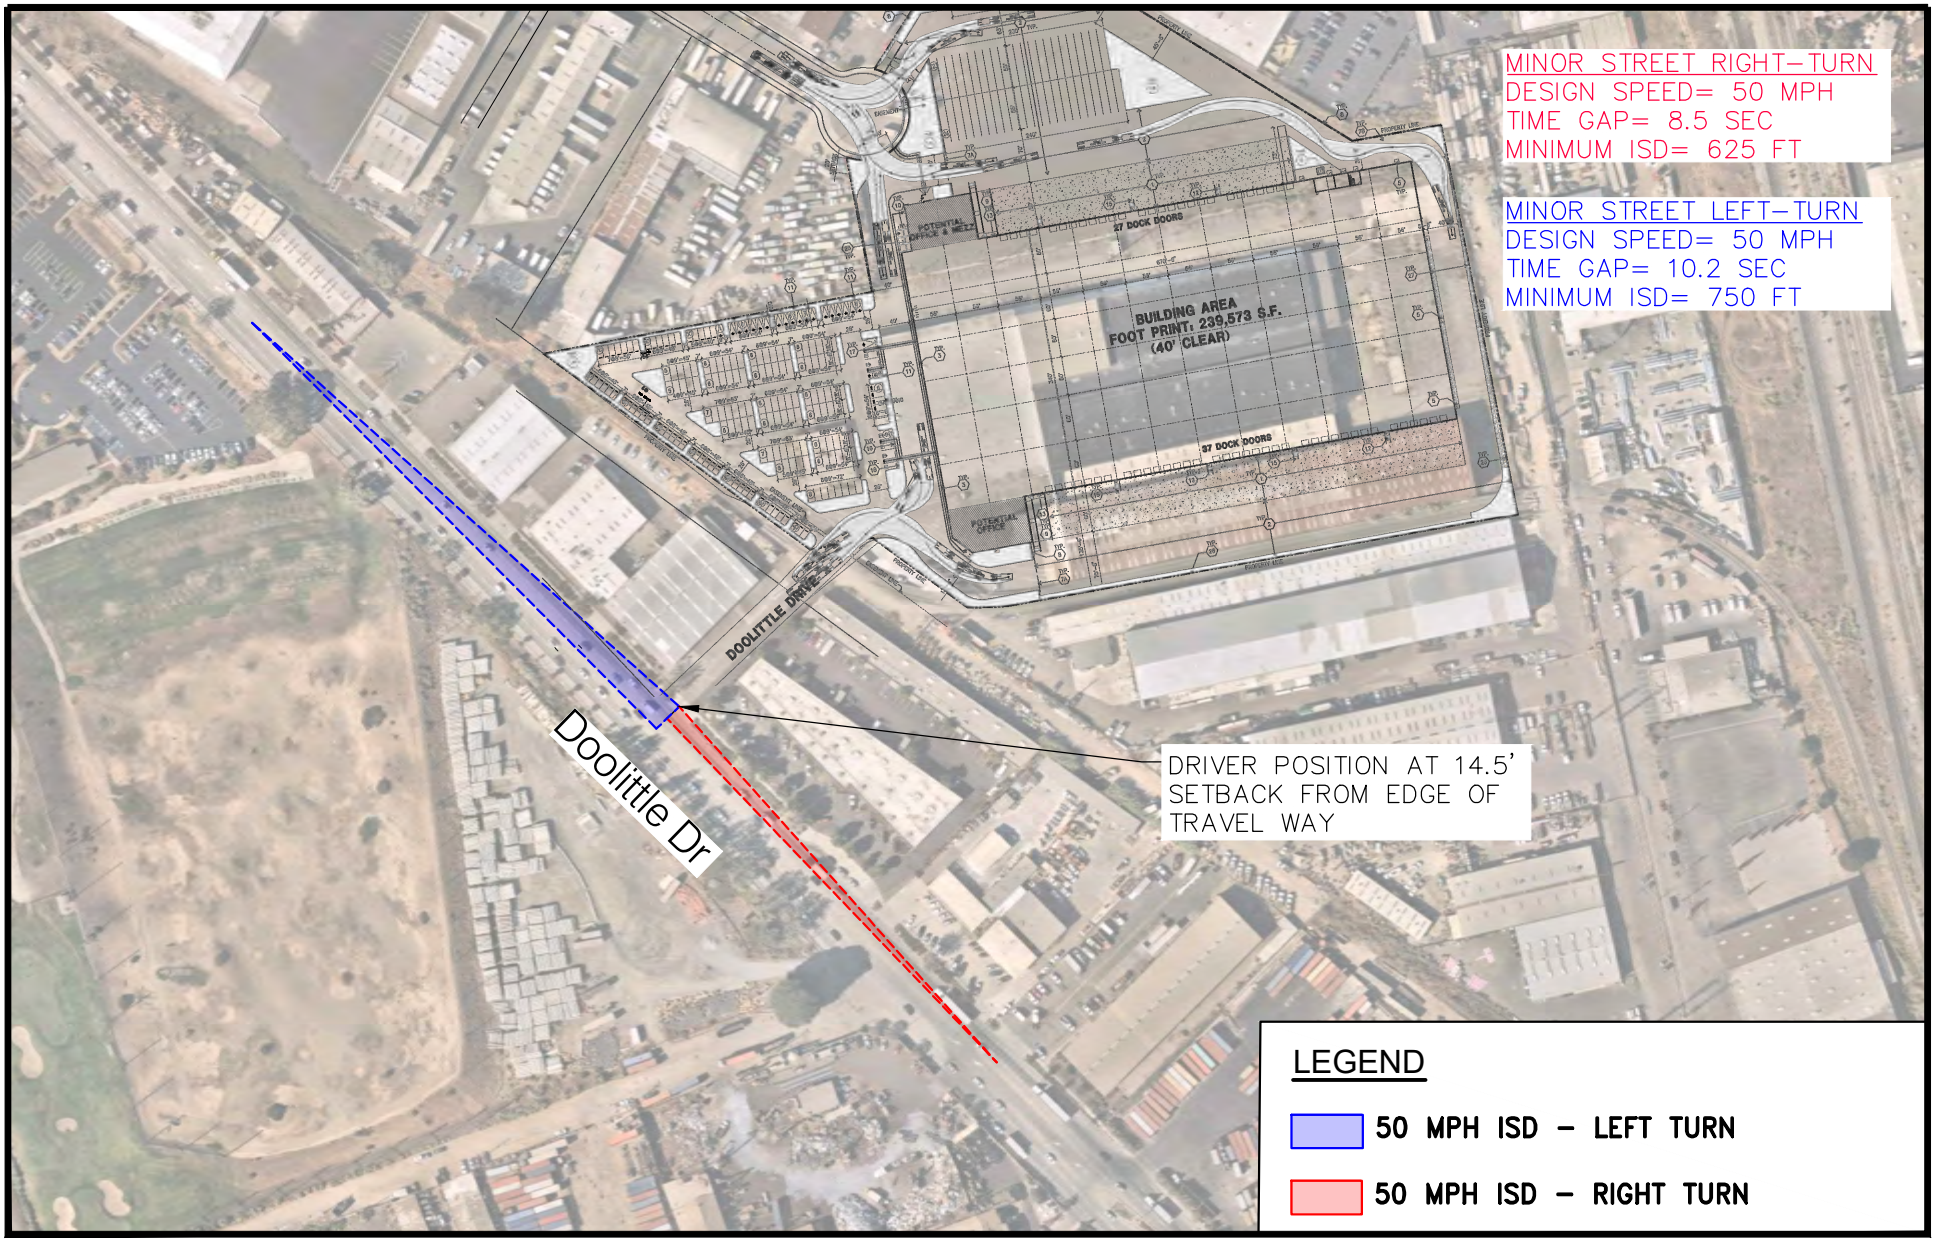
FIGURE 14
TRANSIT FACILITIES

SIGHT DISTANCE

A sight distance analysis for the project driveways was conducted to determine if vehicles exiting the driveway would have adequate sight distance to observe conflicting traffic along the major roadway adjacent to the project site. Intersection sight distance for the project driveway was evaluated following methodology from the American Association of State Highway and Transportation Officials (AASHTO), *A Policy on Geometric Design of Highway and Street, 7th Edition*[5]. Sight distance for each project driveway was determined based on the proposed project site plan and the following AASHTO intersection sight distance criteria formula:



$$\text{Intersection Sight Distance} = 1.47 \times V_{major} \times t_g$$

Where V_{major} is the design speed of the major road and t_g is the time gap for the vehicle to exit the project driveway and enter the major road. No spot speed study was conducted; design speeds were used to determine sight distance.

Intersection #1 – Doolittle Drive and West Project Driveway

Using the time gap for passenger cars, the time gap is 8.5 seconds for a truck to make a right-turn movement onto Doolittle Drive and 10.2 seconds to make a left-turn movement. With a 50-mph design speed along Doolittle Drive, the sight distance criteria for trucks making a right-turn is 625 feet and the sight distance criteria for trucks making a left-turn is 750 feet. As shown in the **Figure 15**, the sight triangles at the West Project Driveway should be clear of obstructions for a vehicle exiting the driveway to observe oncoming northbound and southbound vehicles along Doolittle Drive.

[5] *A Policy on Geometric Design of Highway and Street, 7th Edition,* American Association of State Highway and Transportation Officials (AASHTO), 2018.

INTERSECTION #1 INTERSECTION SIGHT DISTANCE

8. PARKING

This chapter summarizes the Project's parking requirements.

SAN LEANDRO PARKING REQUIREMENTS

Parking requirements for land uses within the City of San Leandro are provided in Chapter 4.08.108 of the San Leandro Municipal Code. This section includes parking requirements for vehicles and bicycles.

VEHICLE PARKING REQUIRED

Required parking for vehicles is based on land use. In accordance with the San Leandro Municipal Code, parking for office, warehousing, distributions, and storage facilities shall be provided at the following rates:

- Office: 1 space per 300 square feet
- Warehousing, Distributions and Storage Facilities: 1 space per 1,500 square feet

Assuming the project site has a 10,000-square foot office and a 229,573-square foot warehouse, the City requires 203 spaces. The project provides a total of 204 parking spaces and 59 trailer parking stalls, which provides adequate parking as required by the City.

The California Green Building Standard Code requires at least 10 percent of the total parking spaces to be Electric Vehicle (EV) Ready parking spaces. With the proposed 204 parking spaces, the project would be required to designate at least 21 EV Ready parking spaces. 21 EV spaces are proposed, which meets the requirement.

The 2010 Americans with Disabilities Act (ADA) Standards for Accessible Design requires at least seven accessible parking spaces for a parking facility with 201 to 300 parking spaces. With the proposed 204 parking spaces, the project would be required to designate at least seven accessible parking spaces. The project is proposing eight accessible parking spaces, which meets the requirement.

BICYCLE PARKING REQUIRED

Required parking for bicycles is based on type of land use. Bicycle parking for office, warehousing, distribution, and storage facilities is to be provided at the following rates:

- Short-term: 5% of the requirement for automobile parking spaces
- Long-term: 5% of the requirement for automobile parking spaces

With 204 parking spaces proposed, this results in 11 required long-term and 11 short-term bicycle parking spaces.

The site provides 12 long-term and 12 short-term bicycle parking spaces, which meets the City's requirement.

9. CONCLUSION

This section summarizes the results and recommendations of this TIA.

PROJECT RECOMMENDATIONS

OFF-SITE ROADWAY IMPROVEMENTS

The project does not propose any off-site roadway improvements associated with the project design.

PEDESTRIAN FACILITIES

Continuous sidewalks exist on both sides of Doolittle Drive, both sides of Adams Avenue, and on the east side of Hester Street. There are also existing signalized crossings in the north, east, and south directions at the intersection of Doolittle Drive and Davis Street, and existing signalized crossings in the north and east directions at the intersection of Doolittle Drive and Davis Street.

Within the project site, there are marked pedestrian crosswalks connecting the accessible parking spaces to the west side building sidewalk. There are sidewalks along the west side of the building which provide access to the office spaces.

BICYCLE FACILITIES

Bicycles will have access to the project site using the Class II bicycle lanes along Doolittle Drive and Adams Avenue. Therefore, no additional bicycle facilities are proposed. The project is proposing to include 12 short-term and 12 long-term bicycle parking spaces on-site, which satisfy the City's requirements.

TRANSIT FACILITIES

Alameda-Contra Costa Transit District (AC Transit) bus routes 34, 35, 73, 98, 805 operate within the study area, with the nearest bus stop located at the intersection of Westgate Parkway and Davis Street, which is approximately 0.9 miles southeast of the project site. The San Leandro LINKS shuttle is a free shuttle to and from the San Leandro BART station, which is 2.1 miles east of the project site, that operates a North Loop and South Loop. The North Loop has an existing stop located at Doolittle Drive and Davis Street. Pedestrians can travel between the LINKS bus stop and the project site using the existing sidewalks located along both sides of Davis Street. Since the LINKS route serves as a sufficient transit facility in proximity to the project along Davis Street to nearby complimentary uses, no additional transit facilities are recommended to be constructed by the project.

PARKING REQUIREMENTS

The project is proposing to provide 204 parking spaces and 59 trailer parking stalls. The City requires a minimum of 204 spaces. Therefore, the project does provide enough parking to satisfy the City's requirements.

The California Green Building Standard Code requires at least 10 percent of the total parking spaces to be Electric Vehicle (EV) Ready parking spaces. With the proposed 204 parking spaces, the project would be required to designate 21 EV Ready parking spaces. 21 EV spaces are proposed, which meets the requirement.

The 2010 Americans with Disabilities Act (ADA) Standards for Accessible Design requires at least seven accessible parking spaces for a parking facility with 201 to 300 parking spaces. With the proposed 204 parking spaces, the project would be required to designate at least seven accessible parking spaces. The project is proposing eight accessible parking spaces, which meets the requirement.

PROJECT DRIVEWAYS

The development of the proposed Project will access the following existing driveways:

- Doolittle Drive and West Project Driveway
  - Stop-controlled westbound movement for project driveway
  - Full access
- Hester Street and North Project Driveway
  - Stop-controlled eastbound and westbound movement for project driveway
  - Full access

PROJECT IMPACTS AND MITIGATIONS

As discussed previously in the Chapter 6, the project VMT/employee (i.e. 15.34 in 2020 and 16.08 in 2040) is not expected to exceed the threshold of significance for VMT/employee for Central Planning Area (i.e. 16.3 in 2020 and 16.2 in 2040) and the project will result in a less than significant transportation impact. No mitigation needed.

PROJECT DEFICIENCIES

LOS DEFICIENCIES

In cases when the project traffic worsens an intersection from an acceptable LOS to an unacceptable LOS or if the project traffic increases the intersection v/c by 0.05 for an intersection that is already operating unacceptably without the project, this is considered a project deficiency. Based on the results of the traffic analysis, the following intersection project deficiencies are noted:

- Intersection #5 – Doolittle Drive and Davis Street
  - Near Term Plus Project (AM peak hour)
  - Cumulative Plus Project (AM peak hour)

Project LOS Deficiency: Doolittle Drive and Davis Street (Intersection #5)

The intersection of Doolittle Drive and Davis Street will have an LOS deficiency in the Near Term Plus Project and Cumulative Plus Project for the AM peak hour.

Near Term Plus Project

In the Near Term Plus Project conditions, the intersection of Doolittle Drive and Davis Street will operate at an unacceptable LOS F with a delay of 127.4 seconds and a v/c ratio of 1.04 in the AM peak hour. The intersection operates at an unacceptable LOS F without the project with a delay of 110.7 seconds and a v/c ratio of 0.97 in the AM peak hour. Since the intersection operates at an unacceptable LOS for without project conditions and the addition of project trips causes the v/c ratio to increase by more than 0.04, this is a project deficiency.

Deficiency Improvement. Optimizing signal timings for this intersection would improve the delay to 89.7 seconds and the v/c ratio to 1.01 in the AM peak hour in the Near Term Plus Project condition. Since the v/c ratio would increase by less than 0.05, this would no longer be a deficiency with the proposed improvement. Traffic signal control analysis sheets can be found in **Appendix C**.

Cumulative Plus Project

In the Cumulative Plus Project conditions, the intersection of Doolittle Drive and Davis Street will operate at an unacceptable LOS F with a delay of 173.2 seconds and a v/c ratio of 1.27 in the AM peak hour. The intersection operates at an unacceptable LOS F without the project with a delay of 156.8 seconds and a v/c ratio of 1.20 in the AM peak hour. Since the intersection operates at an unacceptable LOS for without project conditions and the addition of project trips causes the v/c ratio to increase by more than 0.04, this is a project deficiency.

Deficiency Improvement. Optimizing signal timings for this intersection would improve the delay to 129.6 seconds and the v/c ratio to 1.22 in the AM peak hour in the Cumulative Plus Project condition. Since the v/c ratio would increase by less than 0.05, this would no longer be a deficiency with the proposed improvement. Traffic signal control analysis sheets can be found in **Appendix C**.

QUEUING DEFICIENCIES

In cases when the addition of project trips causes a queue to exceed the turn pocket length or increase by one or more vehicles for vehicle queues that already exceed the turn pocket length, an intersection project queuing deficiency was identified. Based on the results of the traffic analysis, no intersection project queuing deficiencies are noted.

ROADWAY SEGMENT DEFICIENCIES

In cases when the addition of project trips causes an acceptably operating roadway segment to operate at an unacceptable LOS F or increases the v/c of an unacceptably operating roadway segment by more than 0.02, a roadway segment project deficiency was identified. Based on the results of the traffic analysis, the following roadway segment project deficiencies are noted:

- Year 2020 Plus Project
    - Northbound Doolittle Drive from Davis Street to West Project Driveway
- Year 2040 Plus Project
    - Northbound Doolittle Drive from Davis Street to West Project Driveway
    - Southbound Doolittle Drive from West Project Driveway to Davis Street
    - Westbound Davis Street from I-880 SB Ramps to Doolittle Drive

Based on the Alameda CTC methodology, each roadway segment would need to be widened to add additional through lanes on Doolittle Drive and Davis Street. Since each roadway segment has adjacent land uses and is built out, it is infeasible to add additional travel lanes on Doolittle Drive and Davis Street. In addition, Davis Street between the I-880 SB Ramps and Doolittle Drive includes a bridge section that would make widening infeasible.

1 INTRODUCTION

This report presents the results of the traffic analysis (TA) for the proposed 880 Doolittle development (Project), which is located at 880 Doolittle Drive within the City of San Leandro as shown on Exhibit 1-1.

The purpose of this TA is to evaluate the potential deficiencies related to traffic and circulation system operations that may result from the development of the proposed Project, and to recommend improvements to mitigate potential deficiencies in order to achieve acceptable circulation system operations. This report has been prepared through consultation with City of San Leandro staff and their consultants.

1.1 SUMMARY OF FINDINGS

The following improvement has been identified as a cumulative traffic deficiency under Horizon Year (2040) traffic conditions:

- The intersection of Doolittle Drive and Project Driveway was found to operate at an acceptable LOS for Existing, E+P, and Horizon Year (2040) Without Project traffic conditions, however the intersection was found to operate at an unacceptable LOS during the peak hours under Horizon Year (2040) With Project traffic conditions. As such, a traffic signal has been recommended at this location and the Project should contribute fair share payment towards this improvement.

Additional details and intersection lane geometrics are provided in Section 1.7 *Site Access Improvements* of this report. The proposed Project will contribute to both existing and future year deficiencies, however, the net change in the proposed Project traffic is not anticipated to have a measurable effect with the exception of the intersection of the intersection of Doolittle Drive and Project Driveway.

1.2 PROJECT OVERVIEW

The Project is proposed to consist of a 106,190 square foot distribution warehouse use (square footage includes mezzanine space). Vehicular and truck traffic access will be provided via Hester Street and Doolittle Drive (see Exhibit 1-2). Specifically, all truck access to the site will occur off Hester Street, employee access is provided via both Hester Street and Doolittle Drive (via Project Driveway), and all van access is to occur off of Doolittle Drive (via Project Driveway). Regional access to the Project site is provided via the I-880 Freeway via 98th Avenue and Davis Street interchanges.

EXHIBIT 1-1: LOCATION MAP

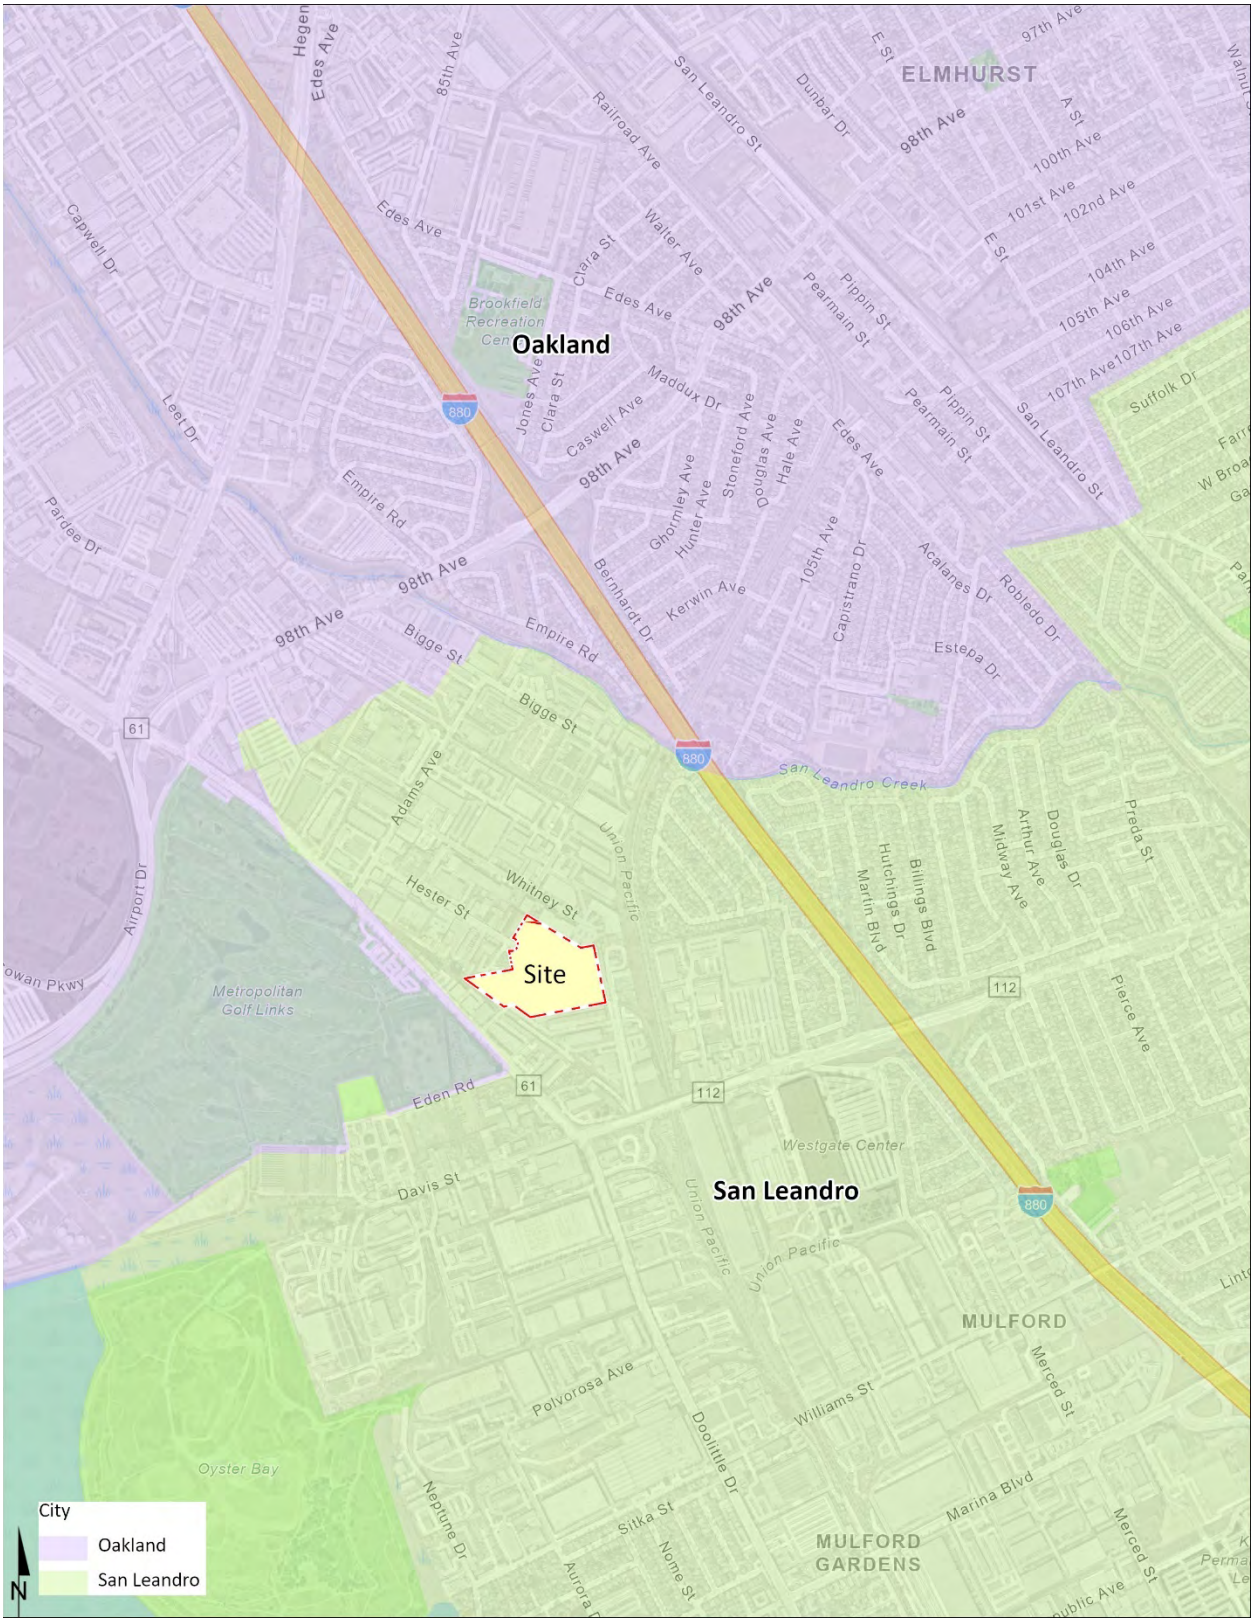

EXHIBIT 1-2: PRELIMINARY SITE PLAN

The trip generation estimates for the proposed Project have been developed using data provided by the future tenant. The Project is estimated to generate 1,136 two-way trips per day on a typical weekday with approximately 196 AM peak hour trips and 83 PM peak hour trips. The site is currently occupied by an existing use, as such, the Project is anticipated to generate 409 fewer two-way trips per day, with 32 net new AM peak hour trips and 58 fewer net PM peak hour trips. The assumptions and methods used to estimate the Project's trip generation characteristics are discussed in greater detail in Section 4.1 *Project Trip Generation* of this report.

1.3 ANALYSIS SCENARIOS

For the purposes of this traffic study, potential deficiencies to traffic and circulation have been assessed for each of the following conditions:

- Existing (2020)
- Existing Plus Project (E+P)
- Horizon Year (2040) Without and With Project

1.3.1 EXISTING (2020) CONDITIONS

Information for Existing (2020) conditions is disclosed to represent the baseline traffic conditions as they existed at the time this report was prepared. Due to the currently ongoing COVID-19 pandemic, 2015 traffic counts were adjusted by 0.772% per year (compounded annually) over 5 years to reflect 2020 baseline traffic conditions. This annual growth rate is based on the average Association of Bay Area Governments (ABAG) projected growth for employment, population, and households for San Leandro. The 2015 counts (adjusted to 2020) were then compared to the recently collected 2020 counts in order to determine the net changes and to develop an adjustment factor. The average of all applicable locations was calculated to be 127% for AM and 106% for the PM. As such, the locations where historic count data were not available, the 2020 counts that were recently collected were increased by 127% in the AM peak hour and 106% in the PM peak hour. For the locations where both historic and actual 2020 data is available, the final adjusted 2020 traffic volumes were developed by taking the higher of the 2 volumes (between either the adjusted 2015 or the actual 2020).

1.3.2 EXISTING PLUS PROJECT CONDITIONS

The Existing Plus Project (E+P) analysis determines any traffic operation and circulation system deficiencies that would occur on the existing roadway system in the scenario of the Project being placed upon Existing conditions. The net new traffic proposed to be generated by the Project has been utilized for the purposes of this TA (delta of the proposed Project and existing use).

1.3.3 HORIZON YEAR (2040) CONDITIONS

The City's traffic consultant has provided future long-range Horizon Year (2040) Without Project traffic forecasts based on the Alameda Countywide Travel Demand Model. Net new Project traffic has been added to develop the Horizon Year (2040) With Project traffic forecasts. A

comparison of Horizon Year (2040) Without and With Project traffic conditions will be used to identify long-range peak hour cumulative intersection operational deficiencies.

1.4 STUDY AREA

To ensure that this TA satisfies the City of San Leandro traffic study requirements, Urban Crossroads, Inc. has coordinated with City staff to determine the proposed study area for this TA. The 14 study area intersections shown on Exhibit 1-3 and listed in Table 1-1 were selected for this TA. It should be noted, the Project contributes fewer than 50 net new peak hour trips at all study area intersections.

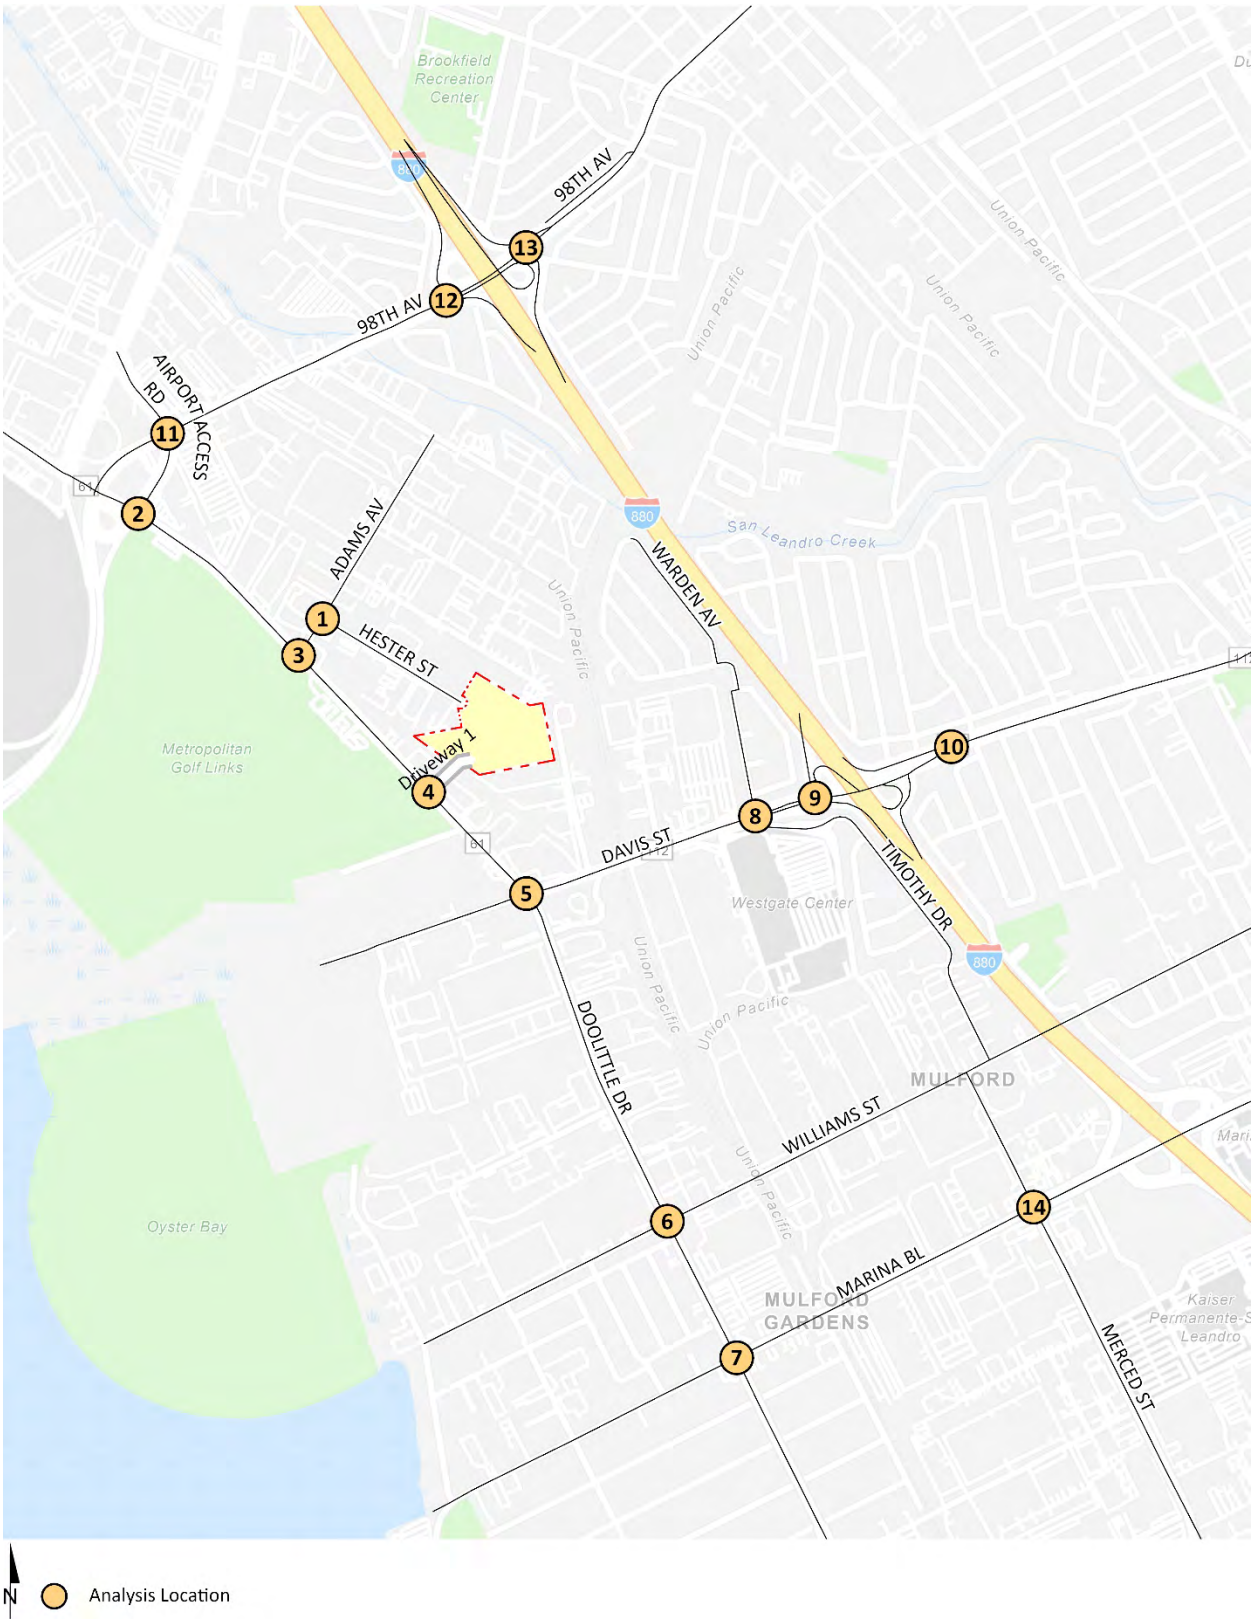

TABLE 1-1: INTERSECTION ANALYSIS LOCATIONS

ID	Intersection	Jurisdiction	CMP?
1	Hester St. & Adams Av.	City of San Leandro	No
2	Doolittle Dr. & Airport Access Rd.	City of Oakland	Yes
3	Doolittle Dr. & Adams Av.	City of San Leandro, City of Oakland	No
4	Doolittle Dr. & Project Dwy.	City of San Leandro, City of Oakland	No
5	Doolittle Dr. & Davis St.	City of San Leandro	Yes
6	Doolittle Dr. & Williams St.	City of San Leandro	No
7	Doolittle Dr. & Marina Bl.	City of San Leandro	Yes
8	Warden Av. & Davis St.	City of San Leandro	No
9	I-880 SB Ramps & Davis St.	City of San Leandro	Yes
10	I-880 NB Ramps & Davis St.	City of San Leandro	Yes
11	Airport Access Rd. & 98th Av.	City of Oakland	Yes
12	I-880 SB Ramps & 98th Av.	City of Oakland	Yes
13	I-880 NB Ramps & 98th Av.	City of Oakland	Yes
14	Merced St. & Marina Bl.	City of San Leandro	Yes

Note: A CMP intersection has been identified for any two CMP roadways that intersect one another.

The intent of a Congestion Management Program (CMP) is to more directly link land use, transportation, and air quality, thereby prompting reasonable growth management programs that will effectively utilize new transportation funds, alleviate traffic congestion and related deficiencies, and improve air quality. Counties within California have developed CMPs with varying methods and strategies to meet the intent of the CMP legislation. (1)

EXHIBIT 1-3: STUDY AREA

1.5 DEFICIENCIES

This section provides a summary of deficiencies by analysis scenario. Section 2 *Methodologies* provides information on the methodologies used in the analysis and Section 6 *Horizon Year (2040) Traffic Conditions* includes the detailed analysis. A summary of level of service (LOS) results for all analysis scenarios is presented on Table 1-2, which indicates that the following intersections will experience deficiencies under Existing and E+P traffic conditions:

- Doolittle Dr. & David St. (#5) – LOS E AM peak hour only
- Merced St. & Marina Bl. (#14) – LOS E PM peak hour only

As shown in Table 1-2, the following additional intersections are anticipated to operate at an unacceptable LOS during one or more peak hours under Horizon Year (2040) Without and With Project traffic conditions:

- Doolittle Dr. & Project Driveway (#4) – LOS E AM peak hour only (With Project only)
- Doolittle Dr. & Marina Bl. (#7) – LOS E PM peak hour only
- Airport Access Rd. & 98th Av. (#11) – LOS F PM peak hour only
- Merced St. & Marina Bl. (#14) – LOS E AM and PM peak hours

TABLE 1-2: SUMMARY OF LOS BY ANALYSIS SCENARIO

1.6 RECOMMENDATIONS

This section provides a summary of deficiencies by analysis scenario. Section 2 *Methodologies* provides information on the methodologies used in the analysis and Section 5 *E+P Traffic Conditions* and Section 6 *Horizon Year (2040) Traffic Conditions* includes the detailed analysis.

1.6.1 E+P CONDITIONS

The following study area intersections are anticipated to operate at an unacceptable LOS under E+P traffic conditions:

- Doolittle Dr. & Davis St. (#5) – LOS E AM peak hour only (consistent with Existing conditions)
- Merced St. & Marina Bl. (#14) – LOS E PM peak hour only (consistent with Existing conditions)

The addition of Project traffic at these two locations is anticipated to result in a change to the volume-to-capacity (v/c) ratio of less than 0.05. As such, no improvements have been recommended at these locations for E+P traffic conditions.

The following turning movements are anticipated to experience queuing issues for E+P traffic conditions and are consistent with existing deficient turning movements, however, the addition of Project traffic to these existing deficiencies result in nominal changes:

- Doolittle Dr. & Davis St. (#5) – Southbound left PM peak hour only
- Doolittle Dr. & Davis St. (#5) – Westbound right turn lane AM and PM peak hours
- Doolittle Dr. & Williams St. (#6) – Southbound left PM peak hour only
- Doolittle Dr. & Marina Bl. (#7) – Southbound left AM and PM peak hours
- Doolittle Dr. & Marina Bl. (#7) – Westbound left AM and PM peak hours
- Warden Av. & Davis St. (#8) – Southbound left AM peak hour only
- Airport Access Rd. & 98th Av. (#11) – Westbound left PM peak hour only

1.6.2 HORIZON YEAR (2040) CONDITIONS

The following study area intersections are anticipated to operate at a deficient LOS during one or both peak hours under Horizon Year (2040) Without Project traffic conditions:

- Doolittle Dr. & Davis St. (#5) – LOS F AM and PM peak hours
- Doolittle Dr. & Marina Bl. (#7) – LOS E PM peak hour only
- Airport Access Rd. & 98th Av. (#11) – LOS F PM peak hour only
- Merced St. & Marina Bl. (#14) – LOS E AM and PM peak hours

The addition of Project traffic is anticipated to have a significant effect on the intersection of Doolittle Drive and the Project Driveway only. The addition of Project traffic at the other two locations is anticipated to result in a change to the v/c ratio of less than 0.05. As such, no improvements have been recommended at those locations for Horizon Year (2040) With Project traffic conditions. Additional details and intersection lane geometrics are provided in Section 1.7 *Recommendations* of this report.

The following additional turning movements are anticipated to experience queuing issues for Horizon Year (2040) Without Project traffic conditions in addition to the existing deficient turning movements, however, the addition of Project traffic to these pre-project deficiencies result in nominal changes:

- Airport Access Rd. & 98th Av. (#11) – Southbound left PM peak hour only
- Merced St. & Marina Bl. (#14) – Westbound left AM peak hour only

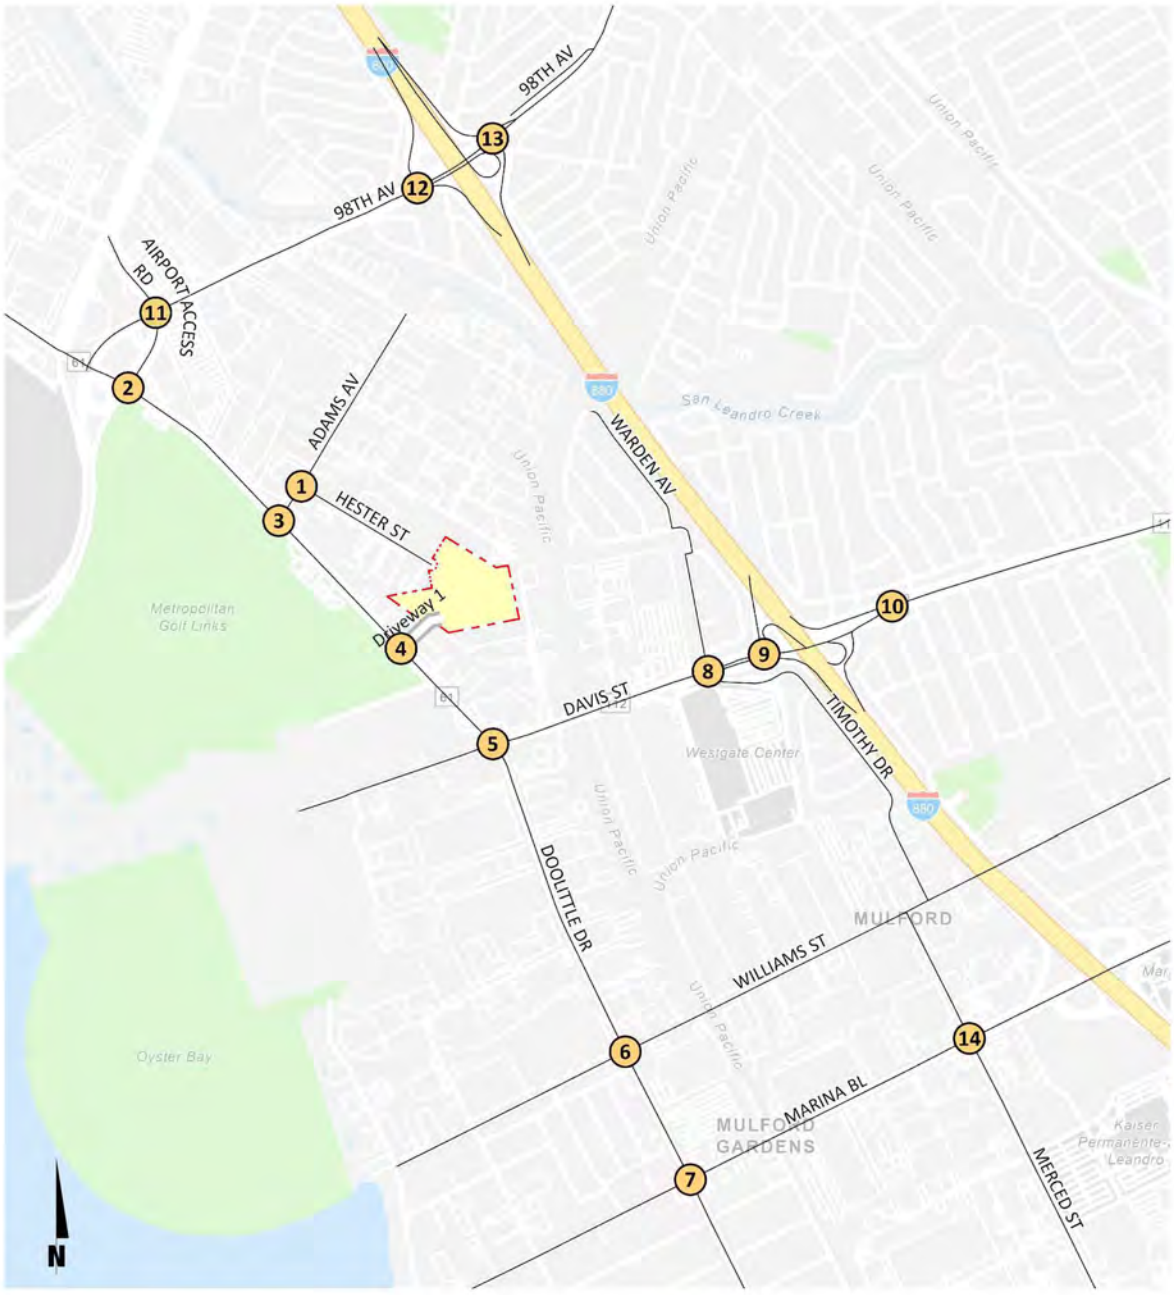
1.7 SITE ACCESS IMPROVEMENTS

The recommended site access driveway improvements for the Project are described below. Exhibit 1-4 illustrates the site access improvements. Construction of on-site and site adjacent improvements shall occur in conjunction with adjacent Project development activity or as needed for Project access purposes.

Hester St. & Adams Av. (#1) – Maintain existing traffic control and lane geometrics at this intersection.

Hester St. & Project Driveway – This is a new Project driveway/access at the southern terminus of Hester Street. The southbound approach on Hester Street approaching the Project is an existing lane. There is also a new driveway proposed to the southeast corner of the cul-de-sac that will lead into the truck court. There is also a new driveway proposed to the southwest corner of the cul-de-sac that will lead to the passenger car parking lot. Both the Project access points at the southern terminus should be signed with stop controls for the exiting Project traffic.

Doolittle Dr. & Project Driveway (#4) – It is recommended the Project will install a traffic signal at Driveway 1 on Doolittle Drive but would defer the installation of the traffic signal to a future date when the intersection meets the appropriate California Manual on Uniform Traffic Control Devices (CA MUTCD) warrants. The intersection should be monitored, and a traffic signal installed when the appropriate warrants are met. No other lane improvements are recommended.



Site access improvements for the driveways at the southern terminus of Hester Street are also shown on Exhibit 1-4.

Wherever necessary, roadways adjacent to the Project, site access points and site-adjacent intersections will be constructed to be consistent with the identified roadway classifications and respective cross-sections in the City of San Leandro General Plan Circulation Element.

On-site traffic signing and striping should be implemented agreeable with the provisions of the California Manual on Uniform Traffic Control Devices (CA MUTCD) and in conjunction with detailed construction plans for the Project site.

Sight distance at each project access point should be reviewed with respect to standard City of San Leandro sight distance standards at the time of preparation of final grading, landscape, and street improvement plans.

EXHIBIT 1-4: SITE ACCESS RECOMMENDATIONS

= New Traffic Signal
= Stop Sign
= Stop Sign Improvement
= Existing Lane
= Lane Improvement

Note: The Project will install a traffic signal at Driveway 1 on Doolittle Drive but would defer the installation of the traffic signal to a future date when the intersection meets the appropriate CA MUTCD warrants. The intersection should be monitored and a traffic signal installed when the appropriate warrants are met.

1.8 QUEUING ANALYSIS AT THE PROJECT DRIVEWAYS

A queuing analysis was conducted for the Project Driveway on Doolittle Drive in addition to the intersection of Hester Street at Adams Avenue for Horizon Year (2040) With Project traffic conditions to determine the 95th percentile queues. The analysis was conducted for the weekday AM and weekday PM peak hours. The traffic modeling and signal timing optimization software package Synchro/SimTraffic (Version 10) has been utilized to assess queues at the aforementioned intersections.

Synchro is a macroscopic traffic software program that is based on the signalized and unsignalized intersection capacity analyses as specified in the Highway Capacity Manual (HCM). SimTraffic is designed to model networks of signalized and unsignalized intersections, with the primary purpose of checking and fine-tuning signal operations. SimTraffic uses the input parameters from Synchro to generate random simulations. The 95th percentile queue is not necessarily ever observed; it is simply based on statistical calculations (or Average Queue plus 1.65 standard deviations). Many jurisdictions utilize the 95th percentile queues for design purposes. SimTraffic simulations have been recorded 5 times, during the weekday AM and weekday PM peak hours, and have been seeded for 15-minute periods with 60-minute recording intervals. Queuing results are provided in Appendix 1.1. Analysis results are summarized in Table 1-3.

TABLE 1-3: SITE ACCESS PEAK HOUR QUEUING SUMMARY

#	Intersection	Movement	Available Stacking Distance (Feet)	2040 With Project 95th % Queue (ft)		Acceptable? [1]	
				AM	PM	AM	PM
1	Hester St. & Adams Av.	NBL/R	100	68	60	Yes	Yes
		EBT/R	135	4	0	Yes	Yes
		WBL/T	150	34	21	Yes	Yes
4	Doolittle Dr. & Project Driveway	NBT/R	300	168	169	Yes	Yes
		SBL	100	47	32	Yes	Yes
		SBT/R	300	186	160	Yes	Yes
		WBL/R	265	150	86	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet (1 car length) of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

As shown in Table 1-3, there are no queuing issues anticipated at the site access locations for Horizon Year (2040) With Project traffic conditions. Note there is an existing at-grade rail spur located approximately 265-feet east of Doolittle Drive along the Project Driveway. However, the 95th peak hour queues demonstrate that queues are not anticipated to extend back to the existing rail spur.

1.9 TRUCK ACCESS

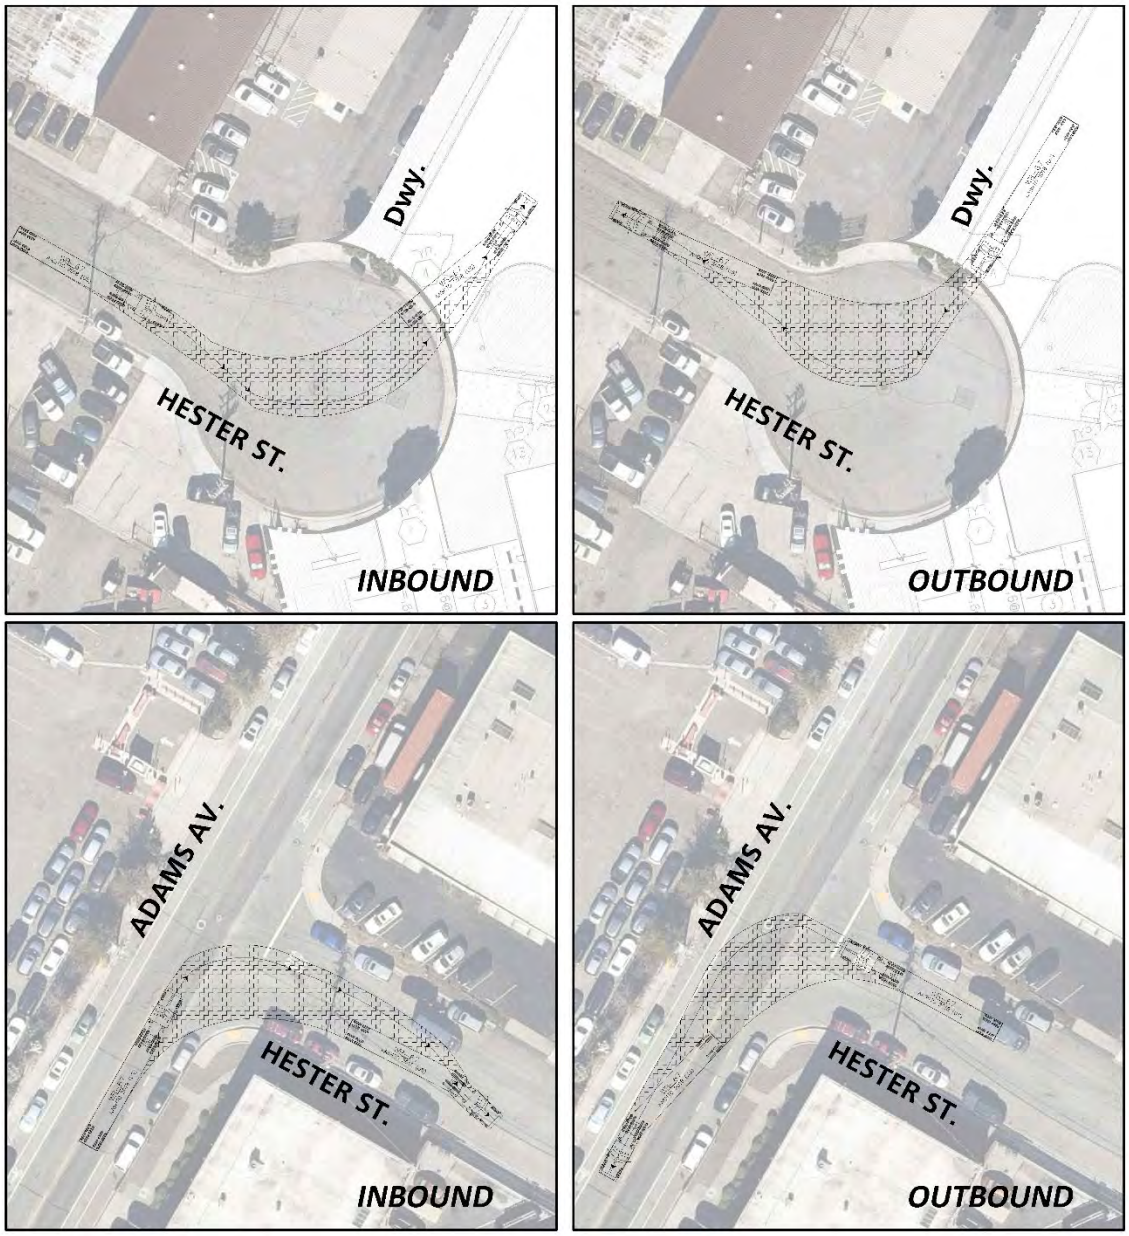
Due to the typical wide turning radius of large trucks, a truck turning template has been overlaid on the site plan at the applicable driveway at the southern terminus of Hester Street in conjunction with the intersection of Hester Street at Adams Avenue in order to determine appropriate curb radii and to verify that trucks will have sufficient space to execute turning maneuvers. As shown on Exhibit 1-5, the existing and proposed curb radii are anticipated to accommodate the wide turning radius of heavy trucks (WB-67, which has a 53-foot trailer). As such, no modifications have been recommended.

1.10 VEHICLE PARKING

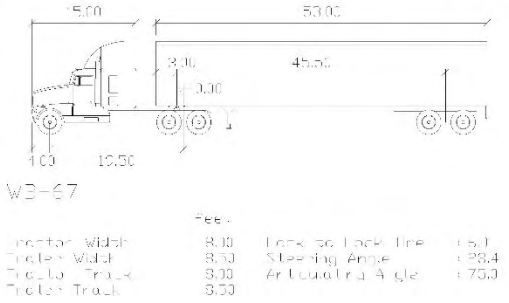
Based on the City's Municipal Code (Section 4.08.108) the Project's minimum parking is as follows:

- Office = 1 space / 300 square feet (sf) = 12,605 sf / 300 = 42 spaces
- Warehouse = 1 space / 1,000 sf = 93,585 sf / 1,500 = 94 spaces
- **Total of 136 spaces**

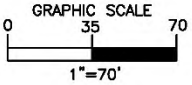
However, the Project is anticipated to provide the following parking spaces:



- Standard Stalls = 197 spaces
- Americans with Disabilities Act (ADA) Standard Stalls = 8 spaces
- ADA Van Stalls = 2 spaces
- Van Stalls = 434 spaces
- Van Staging = 40 spaces
- Van Loading = 36 spaces
- Trailer Stalls = 18 spaces
- **Total of 735 spaces**



Although the City's Municipal Code does not account for the proposed van parking spaces, it has been verified that the proposed number of van stalls can accommodate the anticipated number of vans (434 stalls plus 2 ADA stalls). The Project is anticipated to generate 250 van trips per day which equates to 125 vans. The proposed number of van stalls (436) can adequately park the proposed 125 vans per day and the 125 van drivers that would park their personal vehicles near their vans. As such, the proposed Project exceeds the City's standard parking requirements based on both the standard stall spaces and total parking spaces.



1.11 BICYCLE PARKING

Based on the City's Municipal Code (Section 4.08.128), the minimum bicycle parking is determined based on 5 percent of the vehicle parking, or 10 bicycle parking spaces (based on 207 standard vehicle parking spaces). The Project intends to accommodate 1 bike rack for every 2 spaces, or 104 bicycle racks based on a total of 207 standard vehicle parking spaces.

EXHIBIT 1-5: TRUCK TEMPLATES

This Page Intentionally Left Blank

2 METHODOLOGIES

This section of the report presents the methodologies used to perform the traffic analyses summarized in this report. The methodologies described are generally consistent with City of San Leandro traffic study guidelines.

2.1 LEVEL OF SERVICE

Traffic operations of roadway facilities are described using the term "Level of Service" (LOS). LOS is a qualitative description of traffic flow based on several factors such as speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

2.2 INTERSECTION CAPACITY ANALYSIS

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control. The LOS is typically dependent on the quality of traffic flow at the intersections along a roadway. The Highway Capacity Manual (HCM) methodology expresses the LOS at an intersection in terms of delay time for the various intersection approaches. (2) The HCM uses different procedures depending on the type of intersection control.

2.2.1 SIGNALIZED INTERSECTIONS

The City of San Leandro and City of Oakland require signalized intersection operations analysis based on the methodology described in the HCM. (2) Intersection LOS operations are based on an intersection's average control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections, LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 2-1. Study area intersections have been evaluated using the Synchro (Version 10) analysis software package.

Synchro is a macroscopic traffic software program that is based on the signalized intersection capacity analysis as specified in the HCM. Macroscopic level models represent traffic in terms of aggregate measures for each movement at the study intersections. Equations are used to determine measures of effectiveness such as delay and queue length. The level of service and capacity analysis performed by Synchro takes into consideration optimization and coordination of signalized intersections within a network.

TABLE 2-1: SIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Operations with very low delay occurring with favorable progression and/or short cycle length.	0 to 10.00	A	F
Operations with low delay occurring with good progression and/or short cycle lengths.	10.01 to 20.00	B	F
Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.01 to 35.00	C	F
Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.01 to 55.00	D	F
Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.01 to 80.00	E	F
Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths	80.01 and up	F	F

Source: HCM 2000

The peak hour traffic volumes have been adjusted using a peak hour factor (PHF) to reflect peak 15-minute volumes. Common practice for LOS analysis is to use a peak 15-minute rate of flow. However, flow rates are typically expressed in vehicles per hour. The PHF is the relationship between the peak 15-minute flow rate and the full hourly volume (e.g., PHF = [Hourly Volume] / [4 x Peak 15-minute Flow Rate]). The use of a 15-minute PHF produces a more detailed analysis as compared to analyzing vehicles per hour. Existing PHFs have been used for Existing (2020) baseline, E+P, and Horizon Year (2040) traffic conditions.

2.2.2 UNSIGNALIZED INTERSECTIONS

The City of San Leandro and City of Oakland require the operations of unsignalized intersections be evaluated using the methodology described the HCM. (2) The LOS rating is based on the weighted average control delay expressed in seconds per vehicle (see Table 2-2).

TABLE 2-2: UNSIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay Per Vehicle (Seconds)	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Little or no delays.	0 to 10.00	A	F
Short traffic delays.	10.01 to 15.00	B	F
Average traffic delays.	15.01 to 25.00	C	F
Long traffic delays.	25.01 to 35.00	D	F
Very long traffic delays.	35.01 to 50.00	E	F
Extreme traffic delays with intersection capacity exceeded.	> 50.00	F	F

Source: HCM 2000

At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. The "worst case" movement delay and LOS is reported for the intersection. For all-way stop controlled intersections, LOS is computed for the intersection as a whole.

2.3 TRAFFIC SIGNAL WARRANT ANALYSIS METHODOLOGY

The term "signal warrants" refers to the list of established criteria used by the Caltrans and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This TA uses the signal warrant criteria presented in the latest edition of the California Department of Transportation (Caltrans) California Manual on Uniform Traffic Control Devices *(CA MUTCD)* for all study area intersections. (3)

The signal warrant criteria for Existing conditions are based upon several factors, including volume of vehicular and pedestrian traffic, frequency of accidents, and location of school areas. The Caltrans CA MUTCD indicates that the installation of a traffic signal should be considered if one or more of the signal warrants are met. (3) Specifically, this TA utilizes the Peak Hour Volume-based Warrant 3 as the appropriate representative traffic signal warrant analysis for existing study area intersections for all analysis scenarios. Warrant 3 is appropriate to use for this TA because it provides specialized warrant criteria for intersections with rural characteristics (e.g., located in communities with populations of less than 10,000 persons or with adjacent major streets operating above 40 miles per hour). For the purposes of this study, the speed limit was the basis for determining whether Urban or Rural warrants were used for a given intersection.

Future intersections that do not currently exist have been assessed regarding the potential need for new traffic signals based on future average daily traffic (ADT) volumes, using the Caltrans planning level ADT-based signal warrant analysis worksheets. Traffic signal warrant analyses were performed for the following study area intersection shown in Table 2-3:

TABLE 2-3: TRAFFIC SIGNAL WARRANT ANALYSIS LOCATIONS

ID	Intersection	Jurisdiction
1	Hester St. & Adams Av.	City of San Leandro
4	Doolittle Dr. & Project Dwy.	City of San Leandro, City of Oakland

Traffic signal warrant analyses were performed for all of the full access unsignalized study area intersections. The traffic signal warrant analyses for future conditions are presented in Section 5 *E+P Traffic Analysis* and Section 6 *Horizon Year (2040) Traffic Analysis* of this report.

It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated in order to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with LOS. An

intersection may satisfy a signal warrant condition and operate at or above acceptable LOS or operate below acceptable LOS and not meet a signal warrant.

2.4 QUEUING ANALYSIS

The 95th percentile queuing of vehicles has been assessed at the signalized study area intersections to determine potential queuing deficiencies for turn pockets (note the queuing at unsignalized intersections were addressed as part of the site access evaluation in Chapter 1). Specifically, the queuing analysis is utilized to identify any potential queuing and "spill back" into the adjacent through lanes.

The traffic progression analysis tool and HCM intersection analysis program, Synchro, has been used to assess the potential deficiencies/needs of the intersections with traffic added from the proposed Project. Storage (turn-pocket) length recommendations at the ramps have been based upon the 95th percentile queue resulting from the Synchro progression analysis. The footnote from the Synchro output sheets indicates if the 95th percentile cycle exceeds capacity. Traffic is simulated for two complete cycles of the 95th percentile traffic in Synchro in order to account for the effects of spillover between cycles. In practice, the 95th percentile queue shown will rarely be exceeded and the queues shown with the footnote are acceptable for the design of storage bays.

Although only the 95th percentile queue has been reported in the tables, the 50th percentile queue can be found in the appendix alongside the 95th percentile queue for each study area intersection. The queue length reported is for the lane with the highest queue in the lane group. The 50th percentile or average queue represents the typical queue length for peak hour traffic conditions, while the 95th percentile queue is derived from the average queue plus 1.65 standard deviations. The 95th percentile queue is not necessarily ever observed it is simply based on statistical calculations.

Similar to the peak hour operations analysis, turn pocket storage recommendations have only been recommended if the intersection operations analysis indicates a deficiency during the peak hours.

2.5 MINIMUM LEVEL OF SERVICE (LOS)

2.5.1 CITY OF SAN LEANDRO

The definition of an intersection deficiency has been obtained from the City of San Leandro' 2035 General Plan. LOS D or better is to be maintained at all City-controlled intersections. (4)

2.5.2 CITY OF OAKLAND

The definition of an intersection deficiency has been obtained from the City of Oakland's General Plan. LOS D or better is to be maintained at all City-controlled intersections outside of the Downtown Area and LOS E or better for intersections located within the Downtown Area. (5)

2.5.3 ALAMEDA CMP

The definition of an intersection deficiency has been obtained from the Alameda County 2018 Level of Service Monitoring Report. LOS E or better is to be maintained at CMP intersections, with the exception of the locations that were found to operate at LOS F in the base monitoring years of 1991 and 1992. (1)

2.5.4 CALTRANS

Although Caltrans has gone away from LOS and has focused their determination of traffic impacts and mitigation on vehicle miles traveled (VMT), a minimum LOS D has been utilized for Caltrans controlled ramp-to-arterial intersections for the purposes of this TA.

2.6 SIGNIFICANCE CRITERIA

This section outlines the methodology used in this analysis related to identifying circulation system deficiencies. The following deficiency criteria has been utilized for the study area intersections. To determine whether the addition of project-related traffic at a study intersection would result in a deficiency, the following will be utilized:

- A project-related deficiency is considered significant when a study intersection operates at an acceptable LOS for existing conditions (or pre-project conditions) and the addition of project trips causes the intersection to operate at an unacceptable LOS for existing plus project (E+P) traffic conditions.
- A project-related deficiency is considered significant when a study intersection operates at an unacceptable LOS for existing conditions (or pre-project conditions) and the addition of project trips causes the intersection v/c to increase by 0.05 or more.

This Page Intentionally Left Blank

3 AREA CONDITIONS

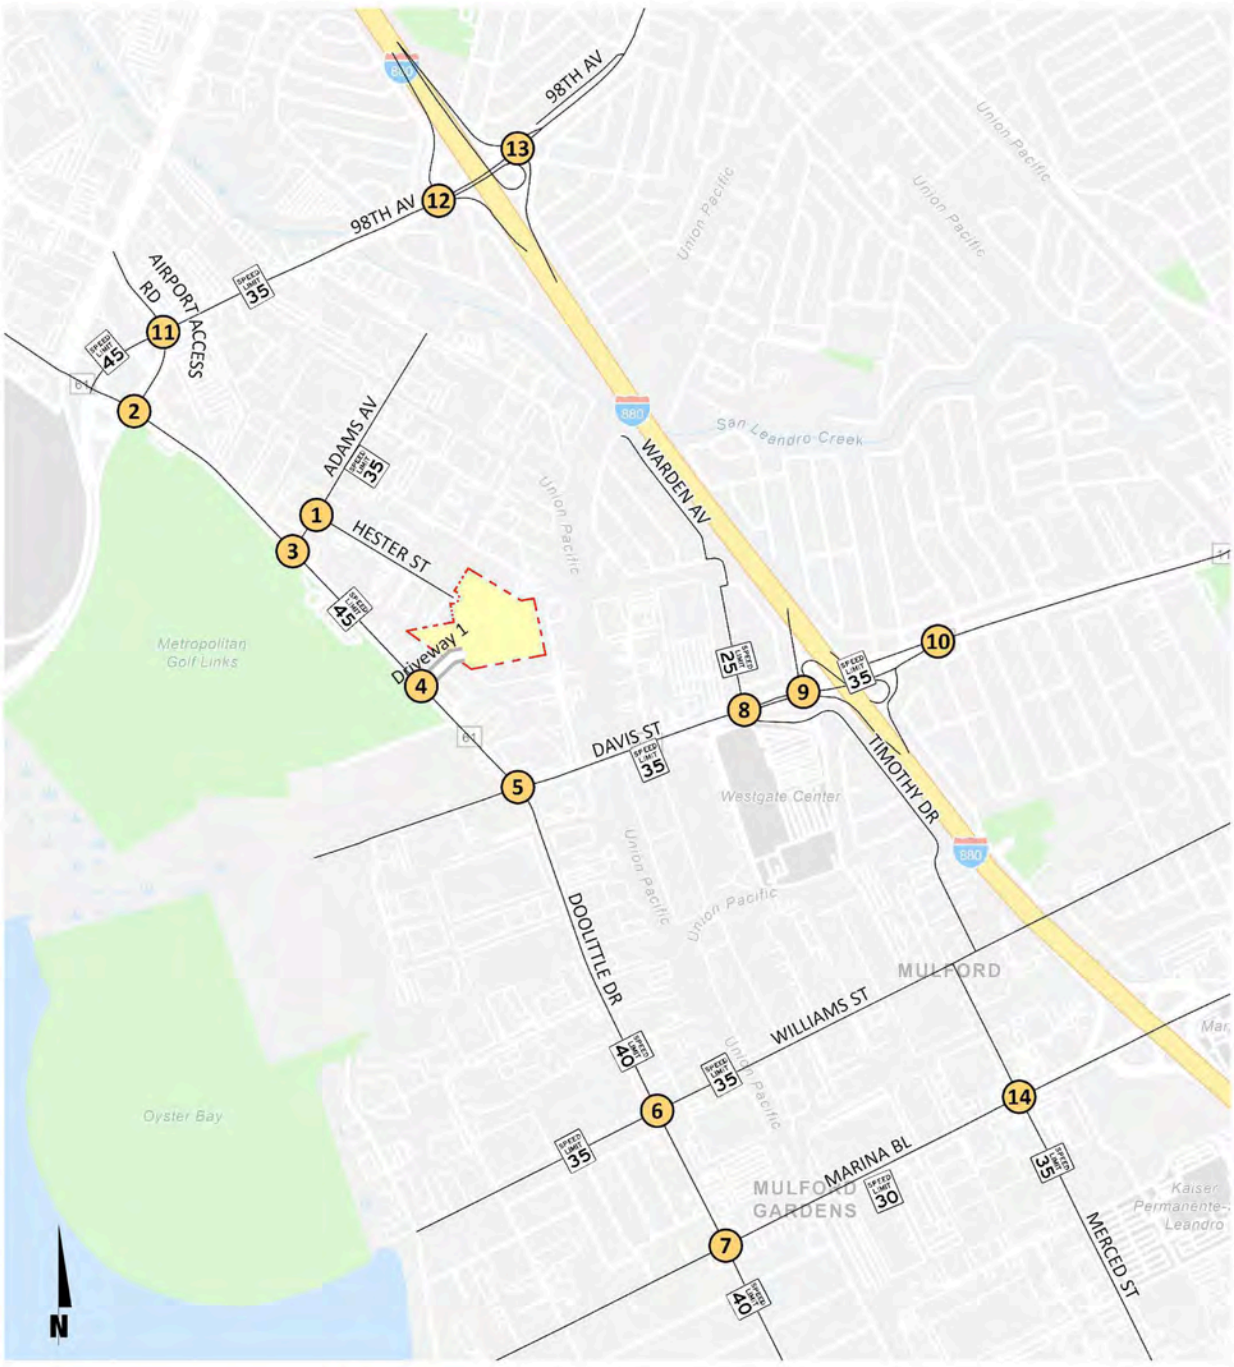
This section provides a summary of the existing circulation network, the City of San Leandro General Plan Circulation Network, and a review of existing peak hour intersection operations, traffic signal warrant, and queuing analyses.

3.1 EXISTING CIRCULATION NETWORK

Pursuant to discussions with the City of San Leandro staff, the study area includes a total of 14 existing intersections as shown previously on Exhibit 1-3. Exhibit 3-1 illustrates the study area intersections located near the proposed Project and identifies the number of through traffic lanes for existing roadways and intersection traffic controls.

3.2 GENERAL PLAN CIRCULATION ELEMENTS

As noted previously, the Project site is located within the City of San Leandro however portions of the study area are lie within the City of Oakland. Exhibit 3-2 shows the City of San Leandro and City of Oakland General Plan Street Classifications.



Arterials can accommodate two to six travel lanes. These facilities serve regional through traffic and connect the major destinations within the City to the freeway system. Access from abutting property is generally restricted. The following roadways are classified as an Arterial within the study area:

- Doolittle Dr.
- Davis St., east of Doolittle Dr.
- Marina Bl.
- Merced St.
- 98th Avenue

Collectors can accommodate two travel lanes with on-street parking and signalized intersections at major intersections. These facilities carry low volumes (less than 10,000 vehicles per day) and connect residential areas to arterials. The following roadways are classified as a Collector within the study area:

- Davis St., west of Doolittle Dr.
- Williams St.
- Timothy Dr./W. Gate Pkwy.
- Adams Av.

EXHIBIT 3-1: EXISTING NUMBER OF THROUGH LANES AND INTERSECTION CONTROLS

2 Doolittle Dr. & Airport Access Rd.
3 Doolittle Dr. & Adams Av.
4 Doolittle Dr. & Dwy. 1
5 Doolittle Dr. & Davis St.
6 Doolittle Dr. & Williams St.
7 Doolittle Dr. & Marina Bl.
8 Warden Av. & Davis St.
9 I-880 SB Ramps & Davis St.
10 I-880 NB Ramps & Davis St.
11 Airport Access Rd. & 98th St.
12 I-880 SB Ramps & 98th St.
13 I-880 NB Ramps & 98th St.
14 Merced St. & Marina Bl.
= Traffic Signal
= Stop Sign
4 = Number of Lanes
D = Divided
U = Undivided
= Free Right Turn
RTO = Right Turn Overlap
N

EXHIBIT 3-2: CITY OF SAN LEANDRO & CITY OF OAKLAND GENERAL PLAN STREET CLASSIFICATION

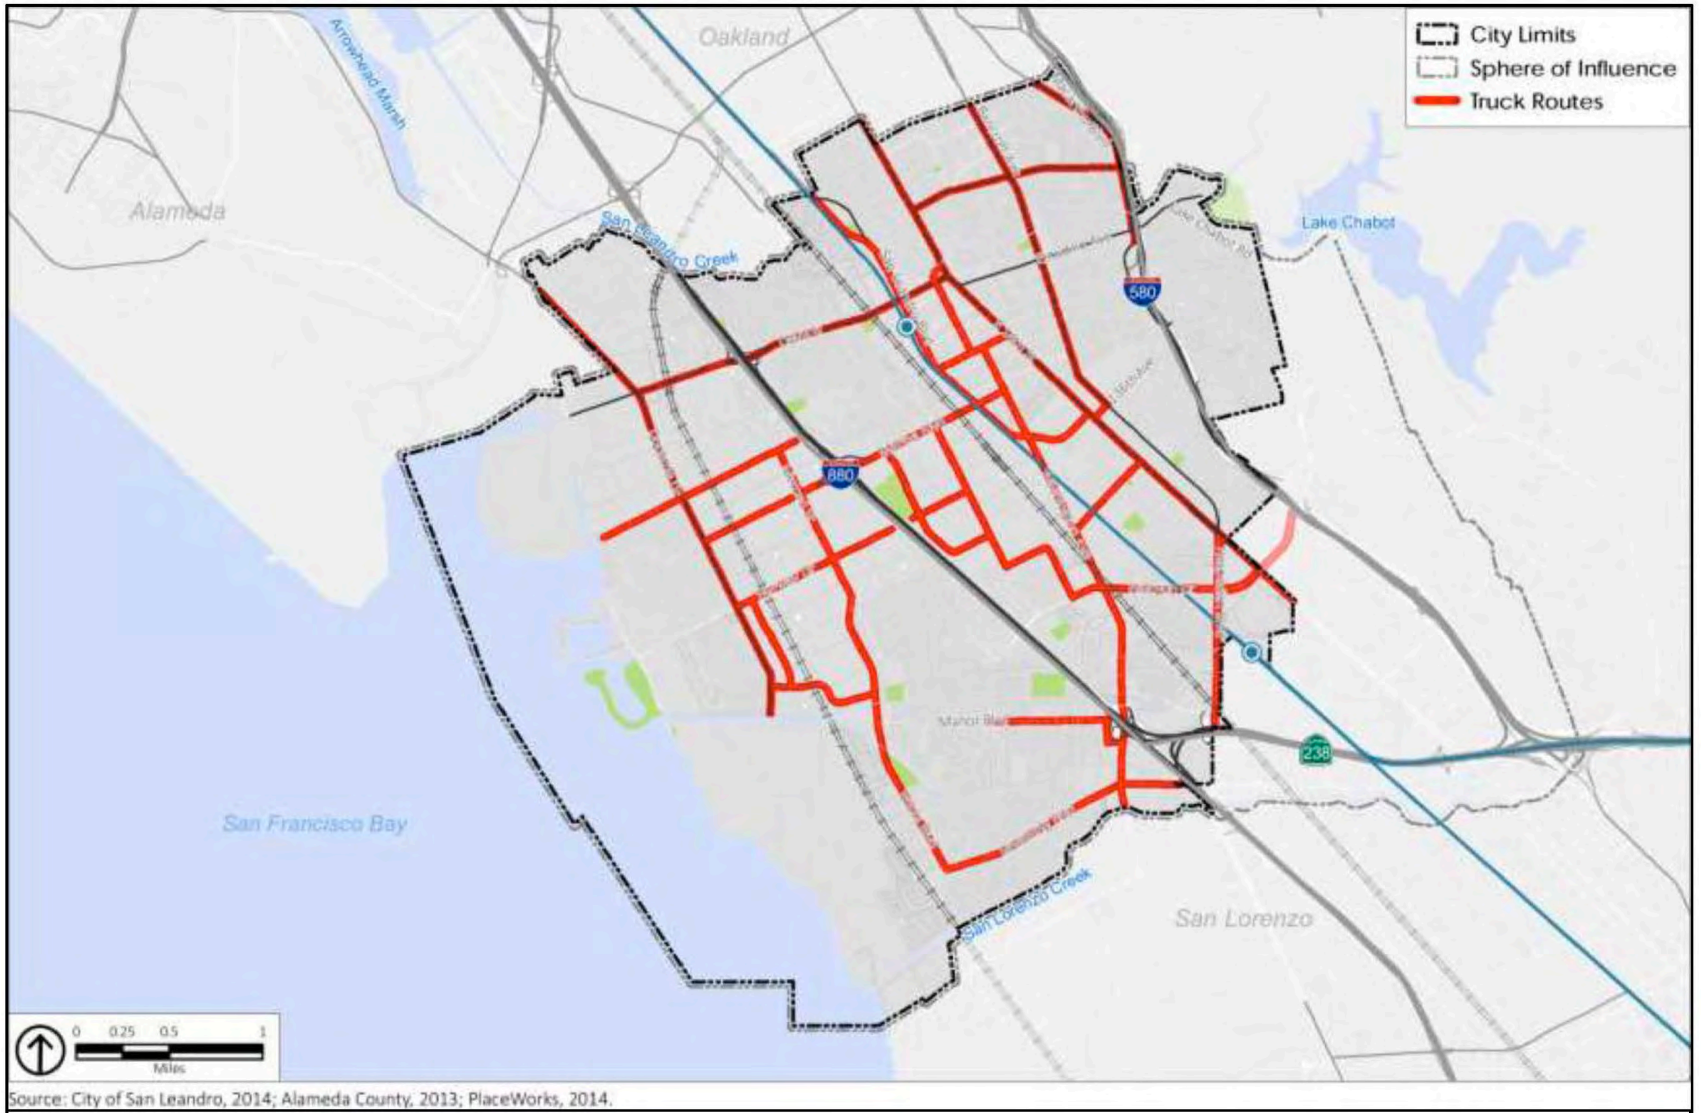
Local Streets/Residential Collector can accommodate two travel lanes with on-street parking typically provided on one side only. These facilities are low-volume and low-speed roadways that connect individual parcels to either Collectors or Arterials. The following roadways are classified as a Local Street within the study area:

- Hester St.
- Warden Av.

3.3 TRUCK ROUTES

The City of San Leandro designated truck route map is shown on Exhibit 3-3. Doolittle Drive, Davis Street, Williams Street, Marina Boulevard, and Merced Street are identified as designated truck routes within the City. These designated truck route maps have been utilized to route truck traffic from the Project throughout the study area.

3.4 TRANSIT SERVICE



Mass transit routes within the study area are shown on Exhibit 3-4. The study area is currently served by Alameda-Contra Costa Transit District (AC Transit), the 3rd largest public bus system in California which serves 13 cities and unincorporated areas of Alameda and Contra Costa counties (364-square mile service area). AC Transit currently has 175,000 riders daily served by their 158 bus lines with approximately 5,400 bus stop locations. AC Transit Routes 34 and 35 runs along Davis Street from east of the I-880 Freeway to Timothy Drive/W. Gate Parkway to Williams Street and Merced Street within the City of San Leandro. AC Transit Route 98 runs along 98th Avenue from Empire Road to east of the I-880 Freeway within the City of Oakland.

The study area is also served by the San Francisco Bay Area Rapid Transit (BART). BART is a public rail transit system that connects the San Francisco Peninsula with communities located in East and South Bays. BART operates 131 miles of track with 50 stations and carry approximately 405,000 trips on an average weekday. The San Leandro BART station is located approximately 1-mile to the east of the I-880 Freeway south of Davis Street on San Leandro Boulevard. The station has connecting transit routes served by AC Transit, LINKS, and the FLEX shuttle. The lines served by the San Leandro BART station include:

- Dublin/Pleasanton to/from Daly City
- Richmond to/from Berryessa/North San Jose Station
- Daly City to/from Berryessa/North San Jose station
- MacArthur to/from Dublin/Pleasanton

The San Leandro LINKS shuttle is a free shuttle to and from BART. There is a North Loop and South Loop. The North Loop runs along Davis Street from the BART station to Marina Boulevard, Merced Street, Williams Street, Doolittle Drive, and Davis Street. There is an existing stop located at Doolittle Drive and Davis Street.

EXHIBIT 3-3: CITY OF SAN LEANDRO TRUCK ROUTES

Source: City of San Leandro, 2014; Alameda County, 2013; PlaceWorks, 2014.

EXHIBIT 3-4: EXISTING TRANSIT ROUTES – AC TRANSIT AND BART

The FLEX Shuttle is a fixed route service similar to LINKS. There is a North Route and South Route through the City of San Leandro. The FLEX Shuttle serves seniors ages 50+ and persons with disabilities (aged 18+) who reside within the City. The North Route runs along portions of Williams Street, Doolittle Drive, Timothy Drive/W. Gate Parkway, and Davis Street (east of Timothy Drive).

There are no existing transit routes along Doolittle Drive near the project site although the San Leandro LINKS shuttle has a stop located at the intersection of Doolittle Drive and Davis Street. Transit service is reviewed and updated periodically to address ridership, budget, and community demand needs. Changes in land use can affect these periodic adjustments which may lead to either enhanced or reduced service where appropriate.

3.5 BICYCLE & PEDESTRIAN FACILITIES

In an effort to promote alternative modes of transportation, the City of San Leandro also includes the existing and proposed bicycle network (see Exhibit 3-5). As shown on Exhibit 3-5, the study area includes existing Class II bike lanes along Adams Street, Doolittle Drive, Williams Street and Merced Street. Class II bike lanes are proposed along Davis Street. Doolittle Drive is proposed as a Class IV bikeway (on-street bike lanes, separated from vehicular traffic via a physical separation). There is also a 5.2-mile shared-use path (Class I) located in the San Leandro Marina Park, which is part of the Bay Trail. The Class I path is an off-street facility that can be used by both bicyclists and pedestrians.

Exhibit 3-6 illustrates the existing pedestrian facilities, which includes sidewalks and crosswalk locations. Sidewalks exist throughout most of the study area with crosswalks provided at all signalized study area intersections.

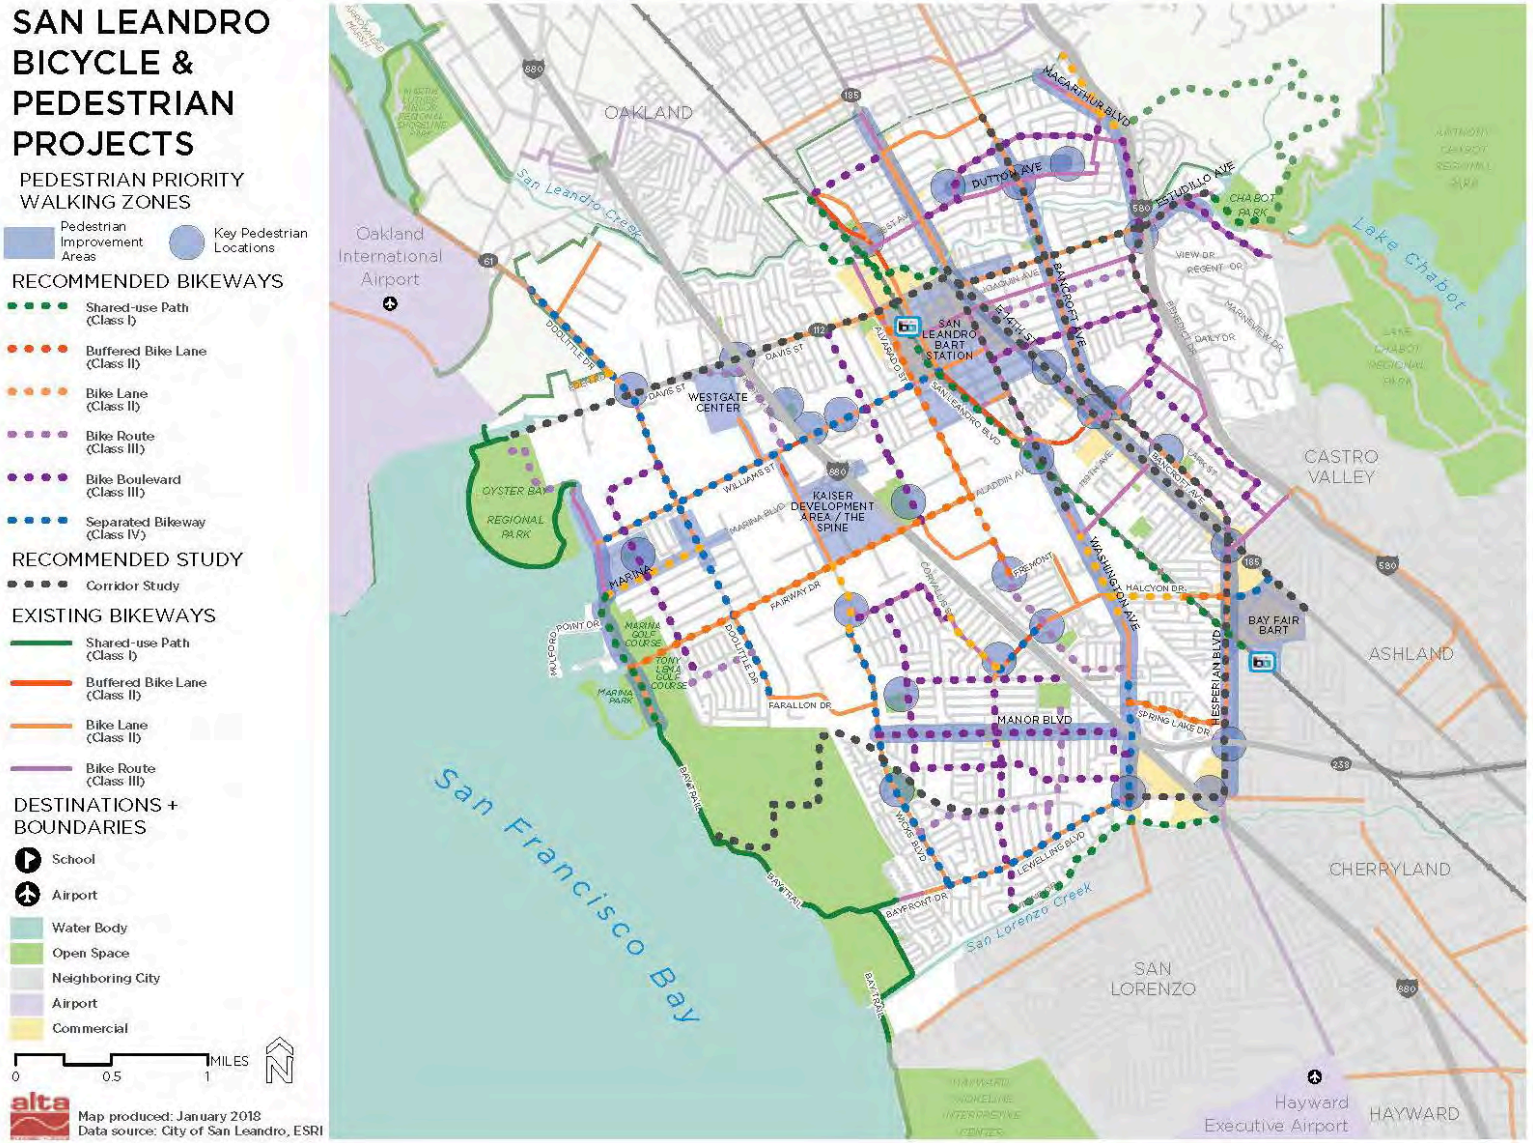
3.6 EXISTING RAIL CROSSINGS

There are 3 major rail lines within the City of San Leandro (Oakland Subdivision, Niles Subdivision, Coastal Subdivision) and these lines connect industrial areas within the City to the Port of Oakland, other markets along the West Coast, and the other areas throughout the State/Nation. All rail lines are under the ownership of Union Pacific Railroad (UPRR). Amtrak also runs along the UPRR within the study area, however, there are no stops within the study area. There are 2 grade-separated railroad crossings within the study area: the overpass on Davis Street and the overpass at the intersection of Doolittle Drive and Airport Access Road. There are also a number of at-grade crossings from various spurs or the UPRR line within the study area:

- Project Driveway, approximately 265-feet east of Doolittle Drive
- Doolittle Drive, approximately 380-feet south of Davis Street
- Williams Street, approximately 840-feet east of Doolittle Drive
- Marina Boulevard, approximately 840-feet east of Doolittle Drive

A queuing analysis will also be prepared to determine whether there are queuing issues at each of the aforementioned at-grade railroad crossings with respect to the adjacent study area intersections. This analysis has been conducted for Horizon Year traffic conditions only.

EXHIBIT 3-5: CITY OF SAN LEANDRO BICYCLE & PEDESTRIAN PLAN



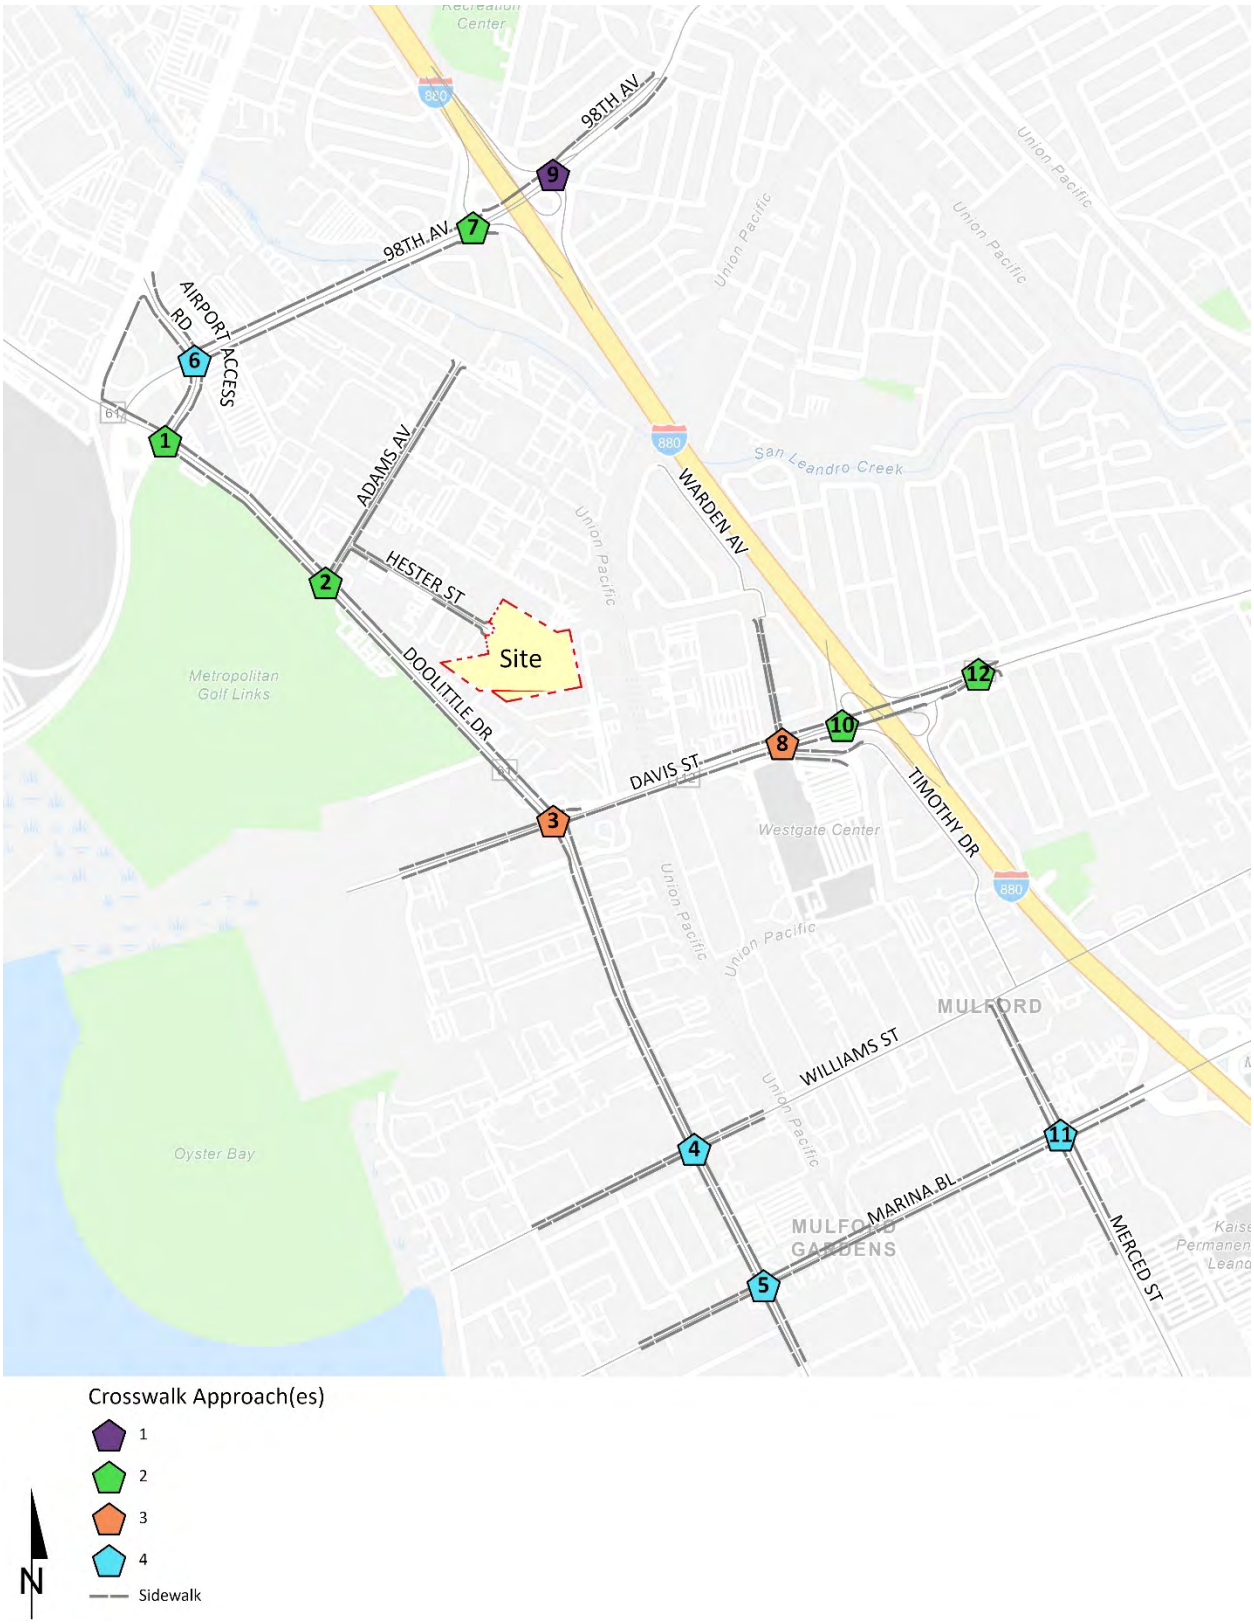


EXHIBIT 3-6: EXISTING PEDESTRIAN FACILITIES

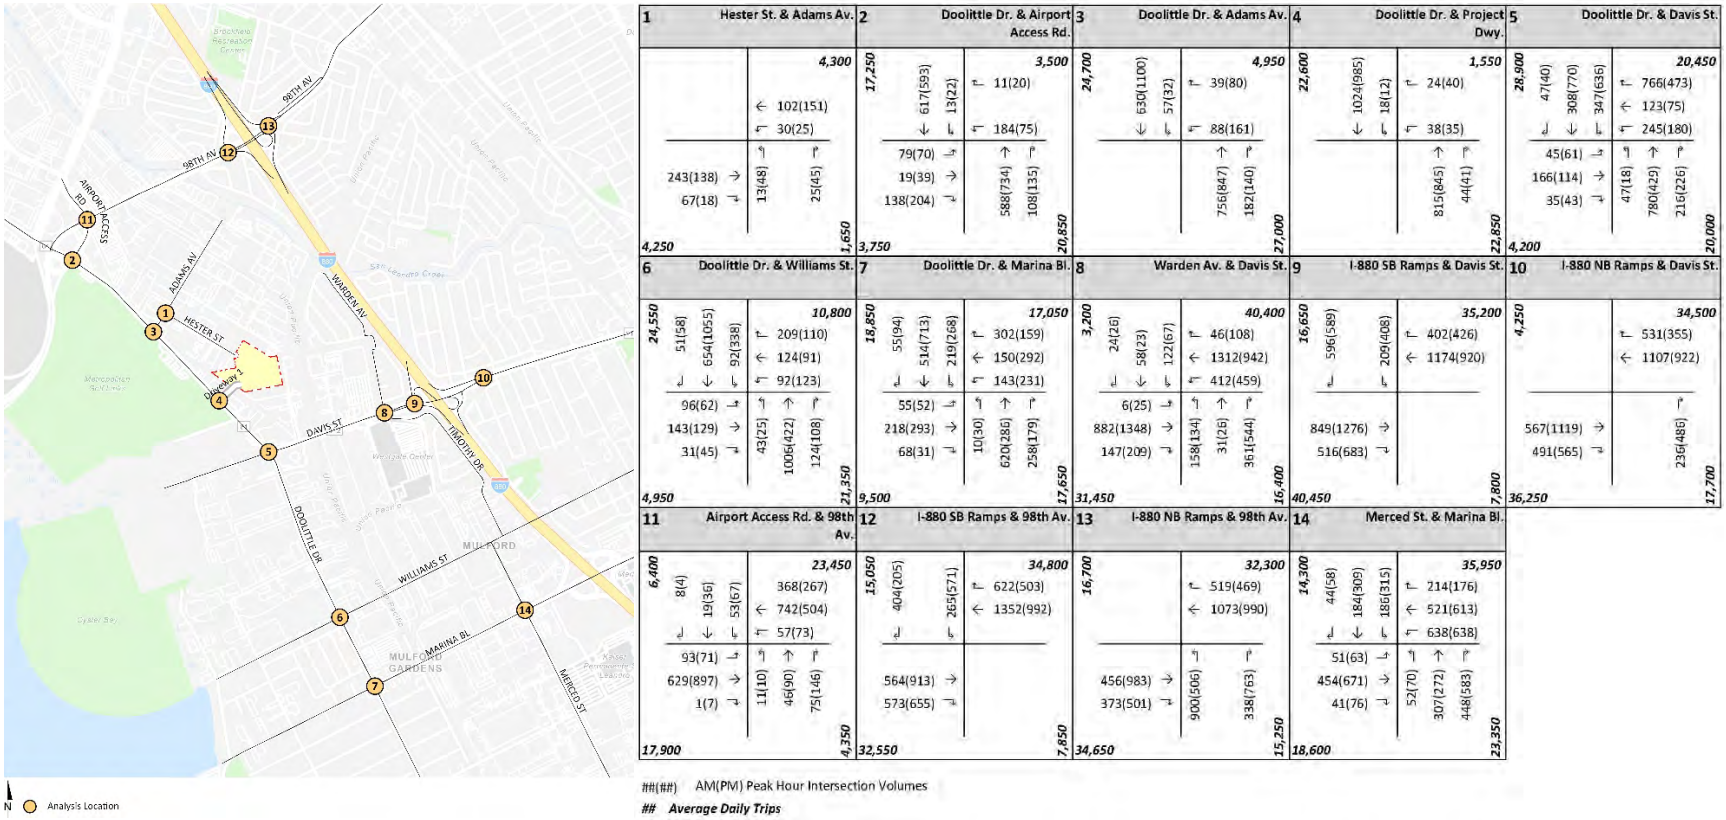
3.7 EXISTING TRAFFIC COUNTS

Due to the currently ongoing COVID-19 pandemic, historic 2015 traffic counts were adjusted by 0.772% per year (compounded annually) over 5 years to reflect 2020 baseline traffic conditions. This annual growth rate is based on the average ABAG projected growth for employment, population, and households for San Leandro. The 2015 counts (adjusted to 2020) were then compared to the recently collected November 2020 counts in order to determine the net changes and to develop an adjustment factor. The average of all applicable locations was calculated to be 127% for AM and 106% for the PM. As such, the locations where historic count data were not available, the 2020 counts that were recently collected were increased by 127% in the AM peak hour and 106% in the PM peak hour. For the locations where both historic and actual 2020 data is available, the final adjusted 2020 traffic volumes used for the purposes of this TA were developed by taking the higher of the 2 volumes (between either the adjusted 2015 or the actual 2020). The following peak hours were selected for analysis for the November 2020 traffic counts:

- Weekday AM Peak Hour (peak hour between 7:00 AM and 11:00 AM)
- Weekday PM Peak Hour (peak hour between 4:00 PM and 7:00 PM)

The raw manual peak hour turning movement traffic count data sheets are included in Appendix 3.1. These raw turning volumes have been flow conserved between intersections with limited access, no access, and where there are currently no uses generating traffic. The traffic counts collected in November 2020 include the vehicle classifications as shown below:

- Passenger Cars
- 2-Axle Trucks
- 3-Axle Trucks
- 4 or More Axle Trucks



Truck traffic has been accounted for in the peak hour operations analysis by entering the percentage of heavy vehicles in the analysis software. The methodology used to derive the existing traffic counts have been reviewed and approved by City staff.

Existing weekday ADT volumes on arterial highways throughout the study area are shown on Exhibit 3-7. Existing ADT volumes were based upon factored intersection peak hour counts collected by Urban Crossroads, Inc. using the following formula for each intersection leg:

Weekday PM Peak Hour (Approach Volume + Exit Volume) x 12 = Leg Volume

Existing weekday AM and weekday PM peak hour intersection volumes are also shown on Exhibit 3-7.

EXHIBIT 3-7: EXISTING (2020) TRAFFIC VOLUMES

3.8 INTERSECTION OPERATIONS ANALYSIS

Existing peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2.2 *Intersection Capacity Analysis* of this report. The intersection operations analysis results are summarized in Table 3-1 which indicates that the study area intersections are currently operating at an acceptable LOS during the peak hours (i.e., LOS D or better), with the exception of the following locations:

- Doolittle Dr. & Davis St. (#5) – LOS E AM peak hour only
- Merced St. & Marina Bl. (#14) – LOS E PM peak hour only

The intersection operations analysis worksheets are included in Appendix 3.2 of this TA.

TABLE 3-1: INTERSECTION ANALYSIS FOR EXISTING (2020) CONDITIONS

#	Intersection	Traffic Control[1]	Delay[2] (secs.)		Volume-to-Capacity (v/c)		Level of Service	
			AM	PM	AM	PM	AM	PM
1	Hester St. & Adams Av.	CSS	11.5	11.0	0.07	0.15	B	B
2	Doolittle Dr. & Airport Access Rd.	TS	20.4	18.3	0.54	0.47	C	B
3	Doolittle Dr. & Adams Av.	TS	9.7	11.0	0.46	0.67	A	B
4	Doolittle Dr. & Project Dwy.	CSS	16.0	15.0	0.18	0.18	C	C
5	Doolittle Dr. & Davis St.	TS	**74.4**	45.4	**0.96**	0.72	**E**	D
6	Doolittle Dr. & Williams St.	TS	25.2	30.7	0.85	0.83	C	C
7	Doolittle Dr. & Marina Bl.	TS	36.2	35.4	0.64	0.71	D	D
8	Warden Av. & Davis St.	TS	41.3	32.8	0.74	0.72	D	C

10	I-880 NB Ramps & Davis St.	TS	11.1	14.6	0.61	0.76	B	B
11	Airport Access Rd. & 98th Av.	TS	30.9	33.4	0.41	0.49	C	C
12	I-880 SB Ramps & 98th Av.	TS	17.9	12.4	0.84	0.58	B	B
13	I-880 NB Ramps & 98th Av.	TS	18.8	34.0	0.80	0.96	B	C
14	Merced St. & Marina Bl.	TS	43.2	**57.9**	0.81	**0.93**	D	**E**

* **BOLD** = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] CSS = Cross-street Stop; TS = Traffic Signal

[2] Per the Highway Capacity Manual (HCM 2000), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

3.9 TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for Existing traffic conditions are based on existing peak hour intersection turning volumes. The following unsignalized study area intersection currently warrants a traffic signal for Existing (2020) traffic conditions based on PM peak hour volumes:

- Doolittle Dr. & Project Driveway (#4)

However, this intersection is currently operating at an acceptable LOS as a cross-street stop-controlled intersection. As such, installation of a traffic signal does not appear necessary from an operational perspective. Existing conditions traffic signal warrant analysis worksheets are provided in Appendix 3.3.

3.10 QUEUING ANALYSIS

A queuing analysis was performed for the signalized study area intersections to assess vehicle queues for the turn pockets that may potentially "spill back" into the adjacent through lanes. Queuing analysis findings are presented in Table 3-2 for Existing traffic conditions. As shown in Table 3-2, the following movements are currently experiencing queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows:

- Doolittle Dr. & Davis St. (#5) – Southbound left PM peak hour only currently spills out of the dual turn pockets and spills back into the adjacent southbound through lane. Due to existing driveways located to the north does not appear feasible as there are existing driveways where access would get affected by an extension of the turn pocket.
- Doolittle Dr. & Davis St. (#5) – Westbound right turn lane AM and PM peak hours currently spills out of the right turn pocket and spills back into the adjacent westbound through lane. The right turn pocket lies within the downgrade of the grade separation over the UPRR rail line and may not be feasible to accommodate additional storage.
- Doolittle Dr. & Williams St. (#6) – Southbound left PM peak hour only is accommodated within the existing two-way left turn lane (striped median) and does not conflict with southbound through traffic.
- Doolittle Dr. & Marina Bl. (#7) – Southbound left AM and PM peak hours currently spills out of the left turn pocket and into the adjacent southbound through lane. The left turn pocket storage cannot be extended due to the existing back-to-back left turn at Barrow Street.
- Doolittle Dr. & Marina Bl. (#7) – Westbound left AM and PM peak hours currently spills out of the left turn pocket and into the adjacent westbound through lane. The left turn pocket storage cannot be extended due to the proximity of the existing driveways to the east and potentially blocking driveway access.
- Warden Av. & Davis St. (#8) – Southbound left AM peak hour only currently spills out of the left turn pocket and into the adjacent southbound through lane. The left turn pocket storage cannot be extended due to the existing intersection of Laura Avenue to the north.
- Airport Access Rd. & 98th Av. (#11) – Westbound left PM peak hour only is accommodated within the existing two-way left turn lane (striped median) and does not conflict with westbound through traffic.

TABLE 3-2: PEAK HOUR TURN LANE QUEUING SUMMARY FOR EXISTING (2020) CONDITIONS

BOLD = 95th percentile queue exceeds the available storage.

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet (1 car length) of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Worksheets for Existing (2020) traffic conditions queuing analysis worksheets are provided in Appendix 3.4.

4 PROJECTED FUTURE TRAFFIC

The Project is proposed to consist of a 106,190 square foot distribution warehouse use (square footage includes mezzanine space). Vehicular and truck traffic access will be provided via Hester Street and Doolittle Drive (see Exhibit 1-2). Specifically, all truck access to the site will occur off Hester Street, employee access is provided via both Hester Street and Doolittle Drive (via Project Driveway), and all van access is to occur off of Doolittle Drive (via Project Driveway). Regional access to the Project site is provided via the I-880 Freeway via 98th Avenue and Davis Street interchanges.

4.1 PROJECT TRIP GENERATION

4.1.1 EXISTING TRIP GENERATION

Existing traffic counts were collected at 880 Doolittle Drive in order to determine the existing trips currently being generated on the site that would be replaced by the Project. Table 4-1 summarizes the counts collected at each driveway and the total for the site. Trip generation has been derived for passenger cars, vans (passenger cars), and trucks. An expanded summary of the existing driveway counts is provided in Appendix 4.1 of this TA.

TABLE 4-1: EXISTING EMPIRICAL DATA

	AM Peak Hour			PM Peak Hour			
Land Use	**In**	**Out**	**Total**	**In**	**Out**	**Total**	**Daily**
Doolittle Access							
Passenger Cars:	61	30	91	17	61	78	792

Truck Trips:	3	4	7	1	1	2	45
Total Trips[1]	**83**	**80**	**164**	**60**	**82**	**142**	**1,546**

[1] Total Trips = Passenger Cars + Truck Trips.

4.1.2 PROPOSED PROJECT TRIP GENERATION

Trip generation represents the amount of traffic that is attracted and produced by a development and is based upon the specific land uses planned for a given project. Trip generation estimates for the proposed Project have been developed using tenant supplied data for the proposed facility. Since the trip generation is based on tenant supplied data, trip generation rates from the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10th Edition, 2017, have not been utilized. Table 4-2 summarizes the Project's trip generation. The proposed Project is anticipated to generate 1,136 two-way trips per day with 196 AM peak hour trips and 83 PM peak hour trips.

TABLE 4-2: PROPOSED PROJECT TRIP GENERATION SUMMARY

	AM Peak Hour			PM Peak Hour			
Land Use	**In**	**Out**	**Total**	**In**	**Out**	**Total**	**Daily**
Proposed Project							
Associates/Drivers:	59	0	59	0	0	0	506
Vans:	0	120	120	0	0	0	250
Flex Vehicles:	0	0	0	40	20	60	80
Self Service Kiosk:[1]	8	8	16	11	11	22	272
4+-axle Trucks:	0	1	1	1	0	1	28
Proposed Project Total	**67**	**129**	**196**	**52**	**31**	**83**	**1,136**

[1] Self service kiosk estimate shown is a maximum projection to conduct a conservative analysis. There is no point of sale associated with these trips.

4.1.3 NET NEW TRIP GENERATION

A comparison between the proposed Project trip generation estimates and the existing use is summarized on Table 4-3. For the purposes of this TA, the net new traffic generated by the proposed Project (less the traffic currently being generated by the site) will be evaluated. As shown in Table 4-3, the Project is anticipated to generate 409 fewer two-way trips per day than the existing use with 32 more AM peak hour trips and 58 fewer PM peak hour trips.

TABLE 4-3: TRIP GENERATION COMPARISON

	AM Peak Hour			PM Peak Hour			
Land Use	**In**	**Out**	**Total**	**In**	**Out**	**Total**	**Daily**
Proposed Project							
Passenger Cars:	67	8	75	11	11	22	778

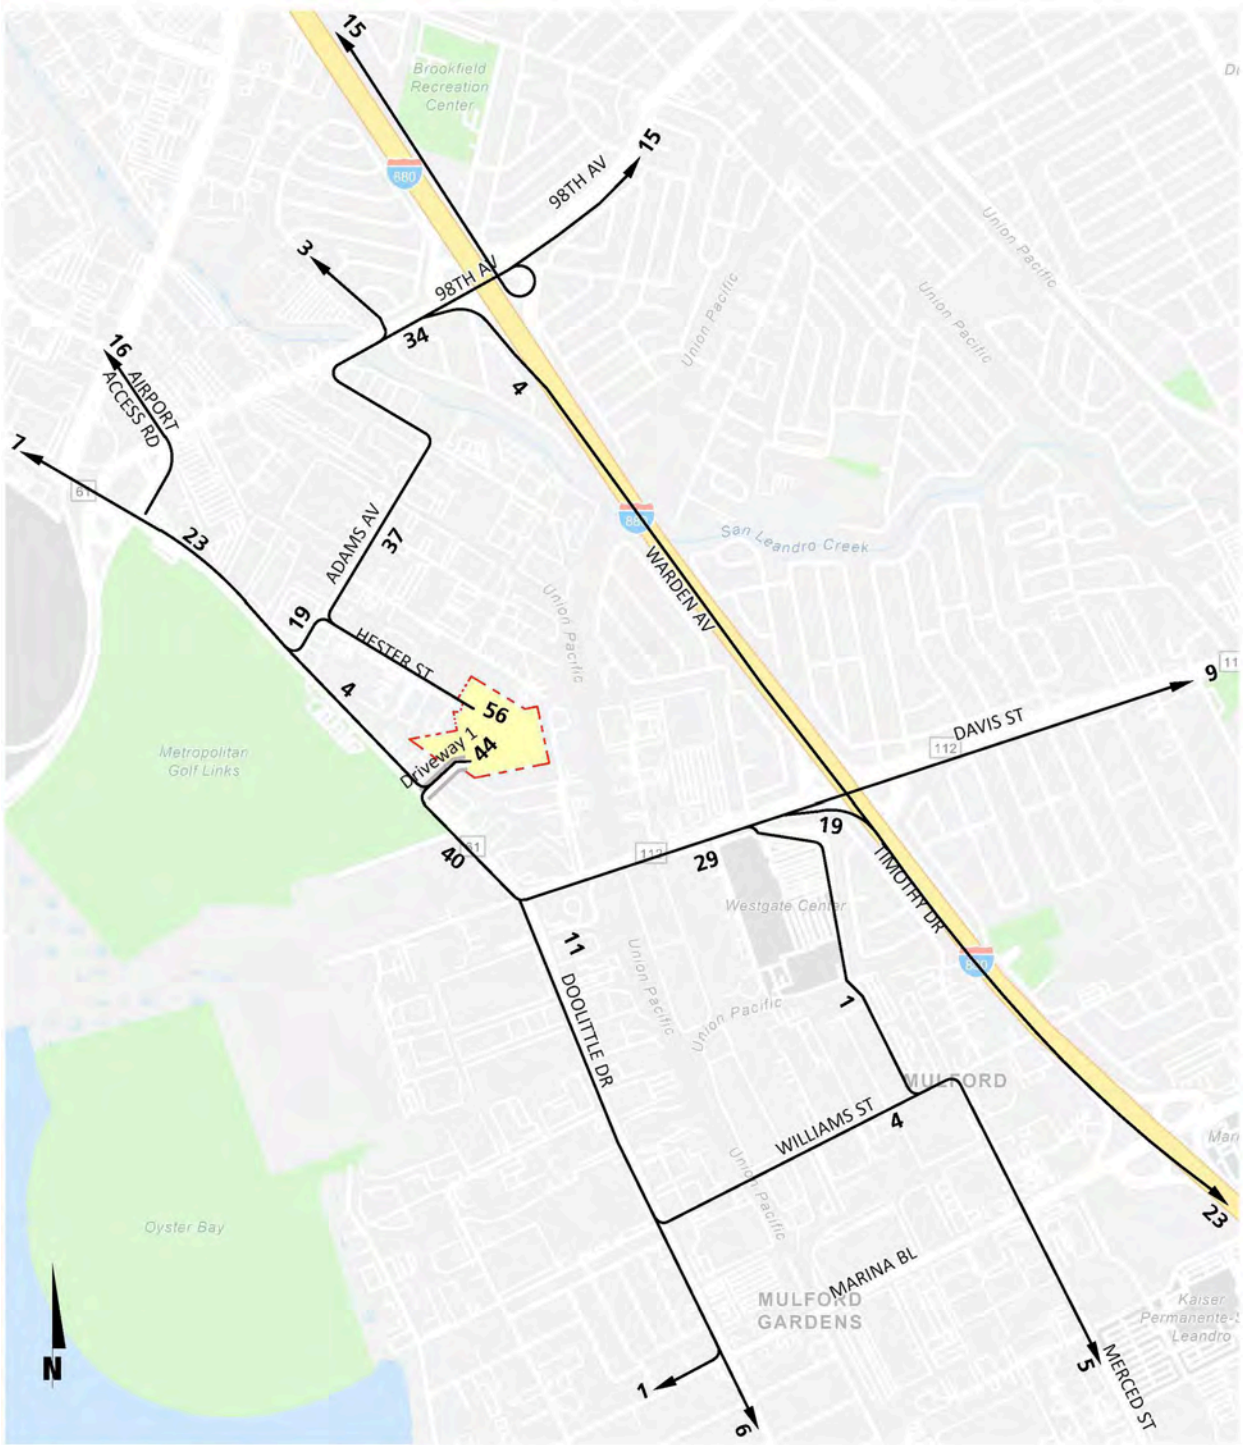
Variance Total (Net New Traffic)	**-16**	**48**	**32**	**-8**	**-50**	**-58**	**-409**

4.2 PROJECT TRIP DISTRIBUTION

Trip distribution is the process of identifying the probable destinations, directions, or traffic routes that will be utilized by Project traffic. The potential interaction between the planned land uses and surrounding regional access routes are considered to identify the route where the Project traffic would distribute. The passenger car trip distribution patterns shown on Exhibit 4-1 are based on the select zone run distribution that was prepared by the City's traffic consultant. However, adjustments have been made to account for the Project access onto Doolittle in addition to other minor changes to routes based on ultimate destination and considerations to the surrounding roadway network. Exhibit 4-2 shows the delivery van/truck distributions and are consistent with the service area zip code data provided by the Project Applicant for the VMT analysis. Each of these distribution patterns was reviewed and approved by the City of San Leandro as part of the traffic study scoping process.



4.3 MODAL SPLIT

The traffic reducing potential of public transit, walking, or bicycling have not been considered in this TA. Essentially, the traffic projections are "conservative" in that these alternative travel modes might be able to reduce the forecasted traffic volumes (employee trips only).

4.4 PROJECT TRIP ASSIGNMENT

The assignment of traffic from the Project area to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project. Based on the identified Project traffic generation and trip distribution patterns, Project ADT and peak hour intersection turning movement volumes are shown on Exhibit 4-3.

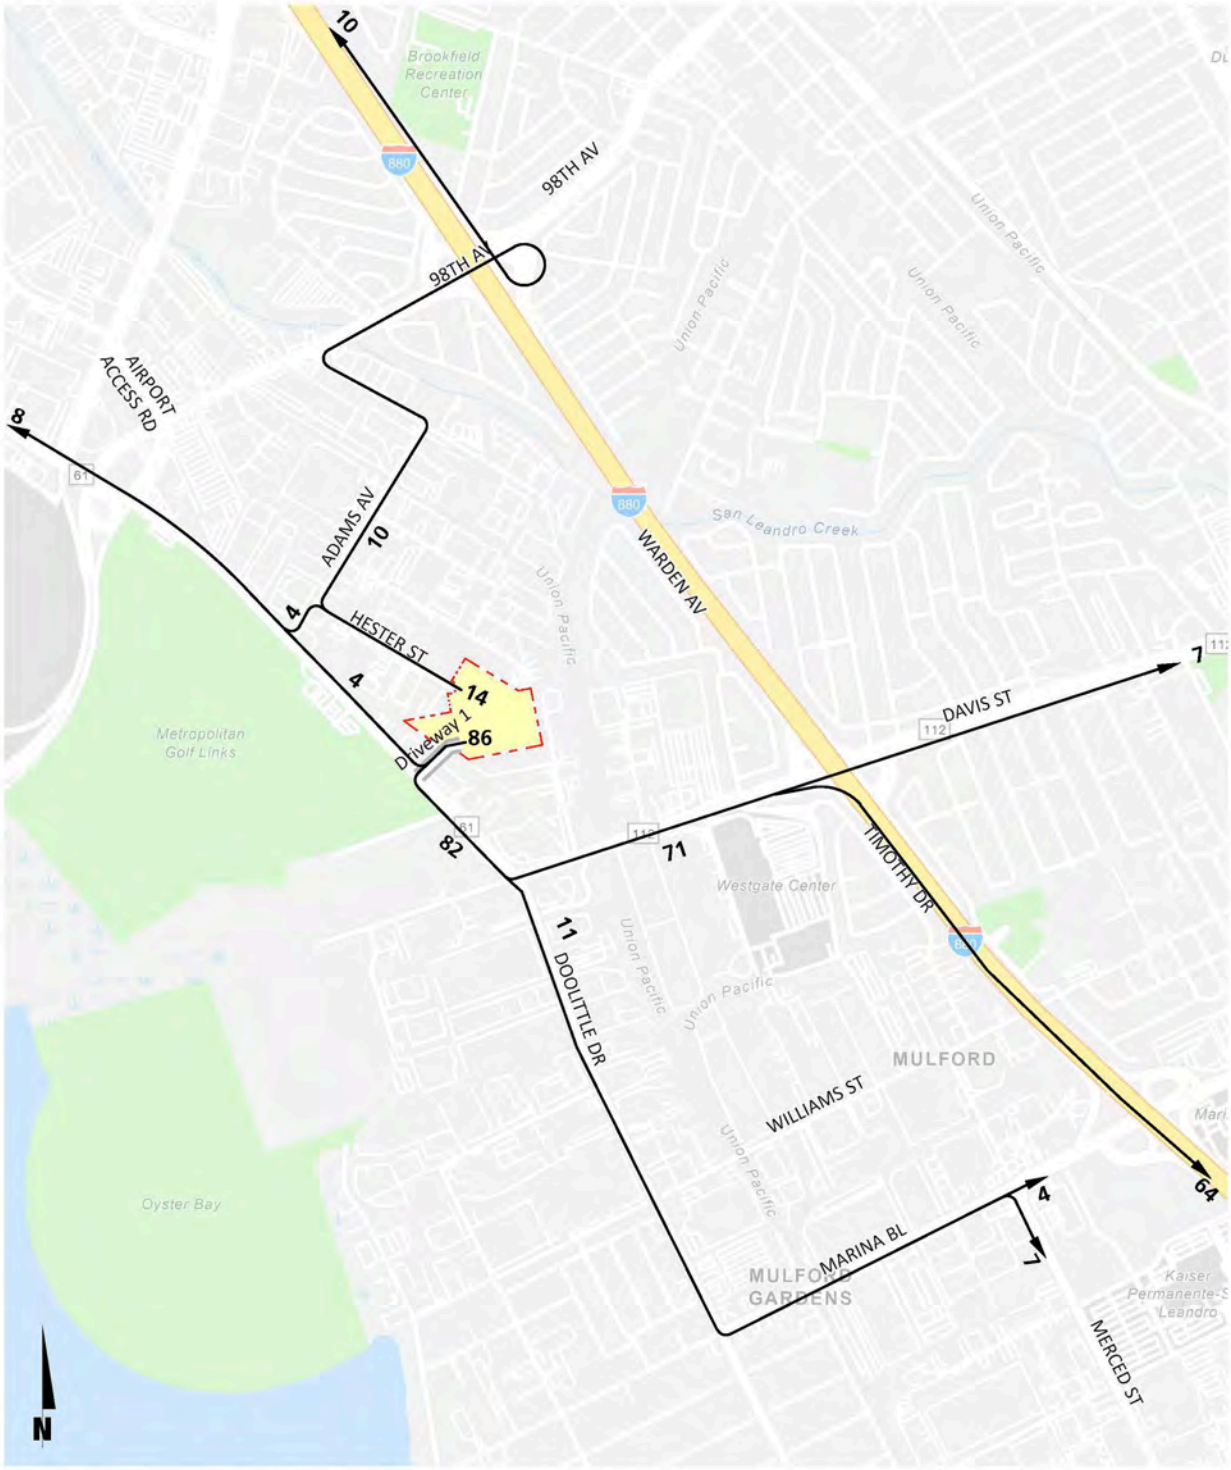

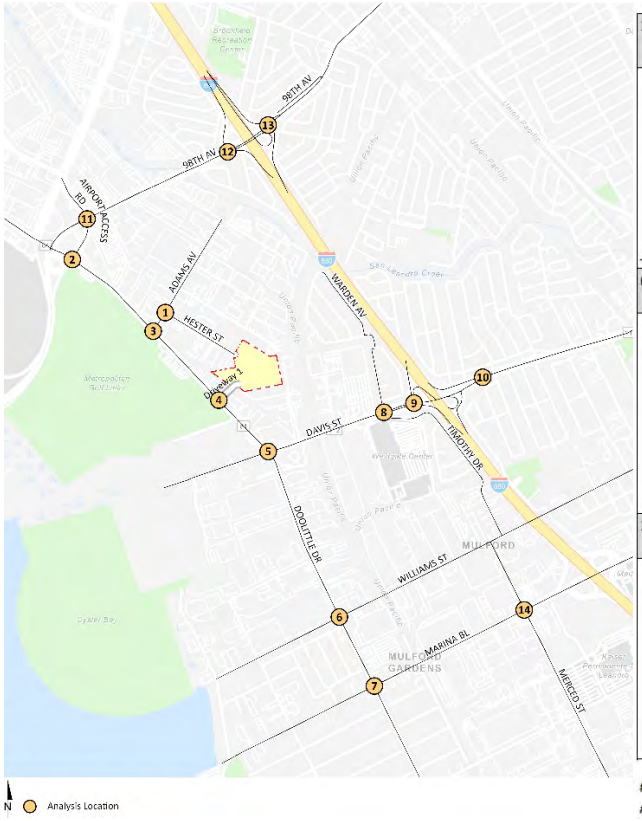

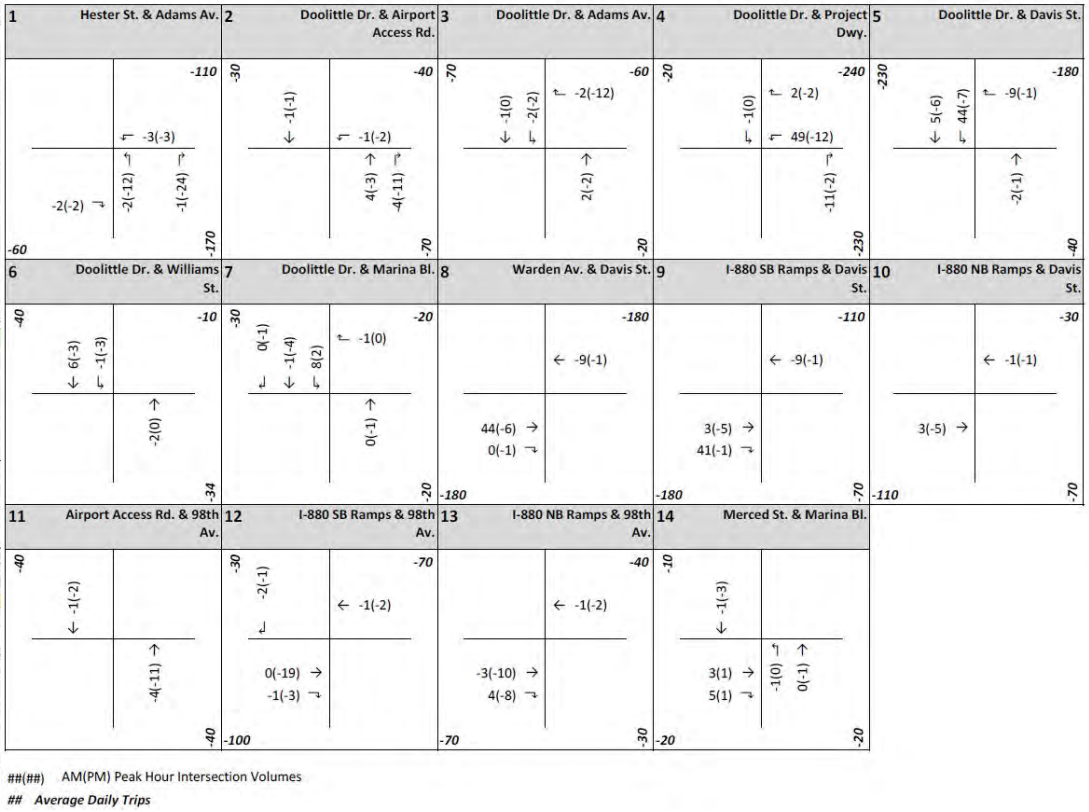

EXHIBIT 4-3: PROJECT ONLY TRAFFIC VOLUMES

4.5 HORIZON YEAR (2040) TRAFFIC FORECASTS

The City's traffic consultant has provided future long-range Horizon Year (2040) Without Project traffic forecasts based on the Alameda Countywide Travel Demand Model using accepted procedures for model forecast refinement and smoothing for study area intersections located within the City of San Leandro. Traffic Counts

The traffic forecasts reflect the area-wide growth anticipated between Existing (2020) conditions and Horizon Year (2040) traffic conditions. In most instances the traffic model zone structure is not designed to provide accurate turning movements along arterial roadways unless refinement and reasonableness checking is performed. Therefore, the Horizon Year peak hour forecasts were refined using the model derived long range forecasts, base (validation) year model forecasts, along with existing baseline traffic (adjusted baseline).

The refined future peak hour approach and departure volumes obtained from the model output data are then entered into a spreadsheet program consistent with the National Cooperative Highway Research Program (NCHRP Report 255), along with initial estimates of turning movement proportions. A linear programming algorithm is used to calculate individual turning movements which match the known directional roadway segment forecast volumes computed in the previous step. This program computes a likely set of intersection turning movements from intersection approach counts and the initial turning proportions from each approach leg.

The future Horizon Year (2040) Without Project traffic forecasts provided by the City's traffic consultant are included in Appendix 4.2. The future Horizon Year (2040) Without Project peak hour turning movements were then reviewed by Urban Crossroads, Inc. for reasonableness, and in some cases, were adjusted to achieve flow conservation. Flow conservation checks ensure that traffic flow between two closely spaced intersections, such as two adjacent driveway locations, is verified in order to make certain that vehicles leaving one intersection are entering the adjacent intersection and that there is no unexplained loss of vehicles. The result of this traffic forecasting procedure is a series of traffic volumes which are suitable for traffic operations analysis. Lastly, net new Project traffic was then added to develop Horizon Year (2040) With Project traffic forecasts.

This Page Intentionally Left Blank

5 E+P TRAFFIC ANALYSIS

This section discusses the traffic forecasts for Existing Plus Project (E+P) conditions and the resulting intersection operations, traffic signal warrant, and queuing analyses.

5.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for E+P conditions are consistent with those shown previously on Exhibit 3-1.

5.2 E+P TRAFFIC VOLUME FORECASTS

This scenario includes Existing (adjusted) traffic volumes plus net new Project traffic. The ADT and peak hour intersection turning movement volumes, which can be expected for E+P traffic conditions are shown on Exhibit 5-1.

5.3 INTERSECTION OPERATIONS ANALYSIS

E+P peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 *Methodologies* of this TA. The intersection analysis results are summarized in Table 5-1, which indicates that there are no additional study area intersections anticipated to operate at an unacceptable LOS, in addition to the locations identified previously under Existing (2020) traffic conditions. The intersection operations analysis worksheets are included in Appendix 5.1 of this TA.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] Per the Highway Capacity Manual (HCM 2000), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[2] CSS = Cross-street Stop; TS = Traffic Signal

[3] For intersections operating below LOS D, an impact would occur if new trips added by the project causes the v/c to increase by 0.05 or more.

##(##) AM(PM) Peak Hour Intersection Volumes

Average Daily Trips

5.4 TRAFFIC SIGNAL WARRANTS ANALYSIS

There are no other unsignalized study area intersections anticipated to meet peak hour volume-based traffic signal warrants under E+P traffic conditions in addition to the location previously warranted under Existing traffic conditions (see Appendix 5.2).

5.5 QUEUING ANALYSIS

A queuing analysis was performed for the signalized study area intersections to assess vehicle queues for the turn pockets that may potentially "spill back" into the adjacent through lanes. Queuing analysis findings are presented in Table 5-2 for E+P traffic conditions. As shown in Table 5-2, the following turning movements are anticipated to experience queuing issues for E+P traffic conditions and are consistent with existing deficient turning movements, however, the addition of Project traffic to these existing deficiencies result in nominal changes:

- Doolittle Dr. & Davis St. (#5) – Southbound left PM peak hour only
- Doolittle Dr. & Davis St. (#5) – Westbound right turn lane AM and PM peak hours
- Doolittle Dr. & Williams St. (#6) – Southbound left PM peak hour only
- Doolittle Dr. & Marina Bl. (#7) – Southbound left AM and PM peak hours
- Doolittle Dr. & Marina Bl. (#7) – Westbound left AM and PM peak hours
- Warden Av. & Davis St. (#8) – Southbound left AM peak hour only
- Airport Access Rd. & 98th Av. (#11) – Westbound left PM peak hour only

Worksheets for E+P traffic conditions queuing analysis worksheets are provided in Appendix 5.3.

5.6 RECOMMENDED IMPROVEMENTS

Improvement strategies have been recommended at intersections that have been identified as deficient under E+P traffic conditions and where the addition of Project traffic would have a significant effect. Improvements have been identified in an effort to achieve an acceptable LOS (i.e., LOS D or better).

BOLD = 95th percentile queue exceeds the available storage.

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet (1 car length) of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

5.6.1 Recommended Improvements To Address Deficiencies At Intersections

As shown previously in Table 5-1, the addition of Project traffic at the two deficient locations is anticipated to result in a change to the v/c ratio of less than 0.05. As such, no improvements have been recommended at these locations for E+P traffic conditions.

5.6.2 Recommended Improvements To Address Deficiencies On Queues

As shown previously in Table 5-2, there are movements anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows under E+P traffic conditions. However, these are existing queuing issues, and the addition of Project traffic is anticipated to have a nominal effect on the peak hour queues. As discussed previously in Section 3.10 *Queuing Analysis*, improvements at some of the turn lanes would not be feasible given the physical surroundings. The peak hour intersection operations analyses for these study area intersections show that the addition of Project traffic is not anticipated to have a significant effect (v/c increase of less than 0.05). As such, consistent with the peak hour intersection operations analyses, no improvements have been recommended to address the peak hour queuing deficiencies.

6 HORIZON YEAR (2040) TRAFFIC ANALYSIS

This section discusses the methods used to develop Horizon Year (2040) traffic forecasts and the resulting intersection operations, traffic signal warrant, and queuing analyses.

6.1 ROADWAY IMPROVEMENTS

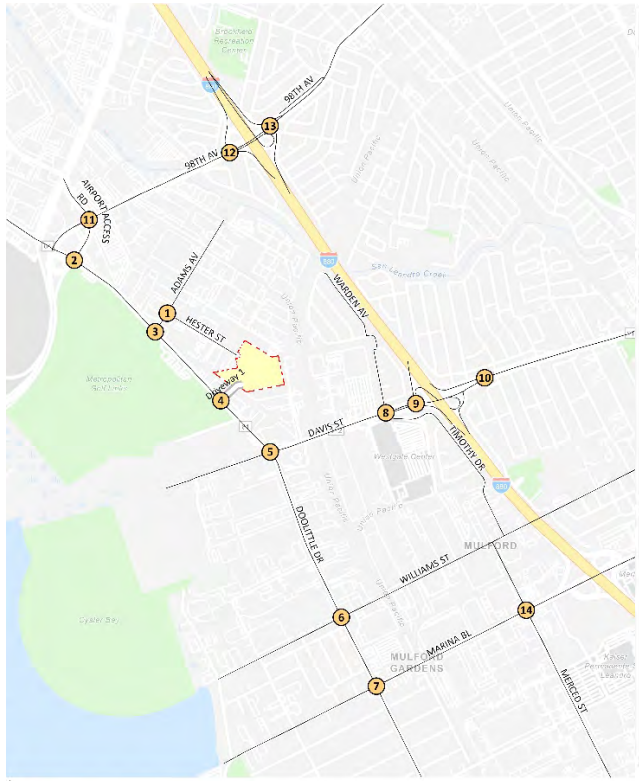
The lane configurations and traffic controls assumed to be in place for Horizon Year (2040) conditions are consistent with those shown previously on Exhibit 3-1.

6.2 HORIZON YEAR (2040) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-processed volumes obtained from the Alameda Countywide Travel Demand Model (see Section 4.5 *Horizon Year (2040) Traffic Forecasts* of this TA for a detailed discussion on the post-processing methodology). The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year (2040) Without Project traffic conditions are shown on Exhibit 6-1.

6.3 HORIZON YEAR (2040) WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-processed volumes obtained from the Alameda Countywide Travel Demand Model plus net new Project traffic. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year (2040) With Project traffic conditions are shown on Exhibit 6-2.



6.4 INTERSECTION OPERATIONS ANALYSIS

LOS calculations were conducted for the study intersections to evaluate their operations under Horizon Year (2040) Without Project conditions with roadway and intersection geometrics consistent with Section 6.1 *Roadway Improvements*. As shown in Table 6-1, the following study area intersections are anticipated to operate at an unacceptable LOS during the peak hours under Horizon Year (2040) Without Project traffic conditions:

- Doolittle Dr. & Davis St. (#5) – LOS F AM and PM peak hours
- Doolittle Dr. & Marina Bl. (#7) – LOS E PM peak hour only
- Airport Access Rd. & 98th Av. (#11) – LOS F PM peak hour only
- Merced St. & Marina Bl. (#14) – LOS E AM and PM peak hours

The addition of Project traffic is anticipated to have a significant effect on the intersection of Doolittle Drive and the Project Driveway only. The intersection operations analysis worksheets for Horizon Year (2040) Without and With Project traffic conditions are included in Appendix 6.1 and Appendix 6.2 of this TA, respectively.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] Per the Highway Capacity Manual (HCM 2000), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[2] CSS = Cross-street Stop; TS = Traffic Signal

[3] For intersections operating below LOS D, an impact would occur if new trips added by the project causes the v/c to increase by 0.05 or more.

[4] Per the HCM methodology, if volume-to-capacity exceeds 1.00 then the level of service is LOS F.

6.5 TRAFFIC SIGNAL WARRANTS ANALYSIS

There is no other unsignalized study area intersections anticipated to meet peak hour volume-based traffic signal warrants under Horizon Year (2040) Without and With Project traffic conditions in addition to the location previously warranted under Existing traffic conditions (see Appendix 6.3 and Appendix 6.4).

6.6 QUEUING ANALYSIS

A queuing analysis was performed for the signalized study area intersections to assess vehicle queues for the turn pockets that may potentially "spill back" into the adjacent through lanes. Queuing analysis findings are presented in Table 6-2 for Horizon Year (2040) Without and With Project traffic conditions. As shown in Table 6-2, the following turning movements are anticipated to experience queuing issues for Horizon Year (2040) Without Project traffic conditions (see Appendix 6.5):

- Doolittle Dr. & Davis St. (#5) – Southbound left PM peak hour only
- Doolittle Dr. & Davis St. (#5) – Westbound right turn lane AM and PM peak hours
- Doolittle Dr. & Williams St. (#6) – Southbound left PM peak hour only
- Doolittle Dr. & Marina Bl. (#7) – Southbound left AM and PM peak hours
- Doolittle Dr. & Marina Bl. (#7) – Westbound left AM and PM peak hours
- Warden Av. & Davis St. (#8) – Southbound left AM peak hour only

BOLD = 95th percentile queue exceeds the available storage.

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet (1 car length) of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

[3] Although 95th percentile queue is anticipated to exceed the available storage for the turn lane, the adjacent through lane has sufficient storage to accommodate any spillover without spilling back and affecting the I-880 Freeway mainline.

- Airport Access Rd. & 98th Av. (#11) – Southbound left PM peak hour only
- Airport Access Rd. & 98th Av. (#11) – Westbound left PM peak hour only
- Merced St. & Marina Bl. (#14) – Westbound left AM peak hour only

The addition of Project traffic to these pre-project deficiencies is anticipated to result in nominal changes (see Appendix 6.6). There are no new queuing deficiencies anticipated as a result of Project traffic.

6.7 RAILROAD QUEUING ANALYSIS

The queuing analysis results for the at-grade railroad crossings have also been summarized on Table 6-3 for Horizon Year (2040) With Project traffic conditions only. As shown in Table 6-3, only the westbound through movement at Doolittle Drive and Marina Boulevard may potentially extend back to the at-grade railroad crossing. It should be noted that while the 95th percentile queue indicates a queuing issue in the PM peak hour only, the average (50th percentile) peak hour queue does not. The 95th percentile queue, while typically used for design purposes, in reality occurs approximately 5 percent of the time. The existing railroad crossing has striping and signing for advance notification of the crossing in both directions of travel on Marina Boulevard. In addition, the crossing itself is equipped with mast arms and warning lights. A potential recommendation for the City to improve peak hour queues in the westbound approach would be to modify the signal timing at Doolittle Drive and Marina Boulevard to clear any queues in advance of approaching trains. Worksheets for Horizon Year (2040) traffic conditions queuing analysis worksheets are provided in Appendix 6.7.

TABLE 6-3: AT-GRADE RAILROAD CROSSING PEAK HOUR QUEUING SUMMARY

#	Intersection	Movement	Available Stacking Distance (Feet)	2040 With Project			
				95th % Queue (ft)		Acceptable?[1]	
				AM	PM	AM	PM
4	Doolittle Dr. & Project Driveway	WBL/R	265	150	86	Yes	Yes
5	Doolittle Dr. & Davis St. (SR-112)	NBT	380	265	103	Yes	Yes
6	Doolittle Dr. & Williams St.	WBT	840	222	346	Yes	Yes
7	Doolittle Dr. & Marina Bl.	WBT	840	419	**932**	Yes	**No**

BOLD = 95th percentile queue exceeds the available storage.

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet (1 car length) of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

6.8 RECOMMENDED IMPROVEMENTS

Improvement strategies have been recommended at intersections that have been identified as deficient under Horizon Year (2040) Without and With Project traffic conditions and where the addition of Project traffic would have a significant effect. Improvements have been identified in an effort to achieve an acceptable LOS (i.e., LOS D or better).

6.8.1 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES AT INTERSECTIONS

The effectiveness of the recommended improvement strategies to address Horizon Year (2040) With Project traffic deficiencies are presented in Table 6-4. As noted previously, the addition of Project traffic is anticipated to have a significant effect on the intersection of Doolittle Drive and the Project Driveway only. The addition of Project traffic at the other four deficient locations is anticipated to result in a change to the v/c ratio of less than 0.05. As such, no improvements have been recommended at those locations for Horizon Year (2040) With Project traffic conditions. It is recommended that the Project contribute fair share payment towards the recommended improvement (signalization). Worksheets for Horizon Year (2040) With Project conditions, with improvements, HCM calculation worksheets are provided in Appendix 6.8.

TABLE 6-4: INTERSECTION ANALYSIS FOR HORIZON YEAR (2040) CONDITIONS WITH IMPROVEMENTS

			Intersection Approach Lanes[1]												Delay[2] (secs.)		Level of Service	
		Traffic	Northbound			Southbound			Eastbound			Westbound						
#	Intersection	Control[3]	L	T	R	L	T	R	L	T	R	L	T	R	AM	PM	AM	PM
4	Doolittle Dr. & Project Dwy.																	
	Without Improvements	CSS	0	2	0	1	2	0	0	0	0	0	1	0	**38.5**	25.6	**E**	D
	With Improvements	**TS**	0	2	0	1	2	0	0	0	0	0	1	0	9.4	7.4	A	A

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right

[2] Per the Highway Capacity Manual (HCM 2000), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[3] CSS = Cross-Street Stop; TS = Traffic Signal; **TS** = Improvement

Table 6-5 provides the fair share calculation for the intersection of Doolittle Drive and Project Driveway. As stated above, the Project should contribute fair share payment towards the identified improvement at this location.

TABLE 6-5: PROJECT FAIR SHARE CALCULATIONS

#	Intersection		Existing	Project	Horizon Year (2040) With Project	Total New Traffic	Project % of New Traffic
4	Doolittle Dr. & Project Dwy.						
		AM:	1,963	39	2,140	177	**22.0%**
		PM:	1,958	-16	2,294	336	0.0%

BOLD = Denotes highest fair share percentage.

6.8.2 RECOMMENDED IMPROVEMENTS TO ADDRESS DEFICIENCIES ON QUEUES

As shown previously in Table 6-2, there are movements anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows under Horizon Year (2040) traffic conditions. However, these are pre-project queuing issues, and the addition of Project traffic is anticipated to have a nominal effect on the peak hour queues. The peak hour intersection operations analysis for these study area intersections show that the addition of Project traffic is not anticipated to have a significant effect (v/c increase of less than 0.05). Similarly, the addition of Project traffic is also not anticipated to have a significant effect to the PM peak hour queue identified at the intersection of Doolittle Drive and Marina Boulevard on Table 6-3. As such, consistent with the peak hour intersection operations analyses, no improvements have been recommended to address the peak hour queuing deficiencies.

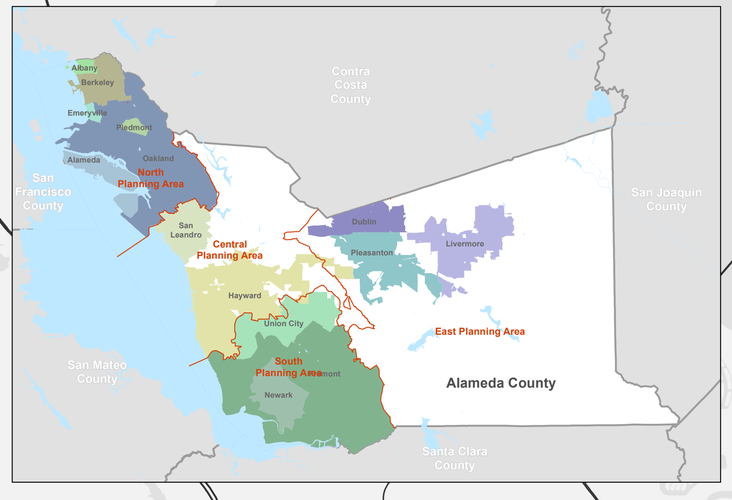
Data Source: Alameda Countywide Travel Model, Plan Bay Area 2040 version, May 2019



Vehicle miles traveled (VMT) = home-based trips (home-based work, school, shopping/errands, social/recreation) at transportation analysis zone (TAZ) containing residence site

VMT also includes estimates of non-home trips generated by residents at the non-residential end of the home-based trip (e.g. lunch trips from workplace)

VMT per capita = home-based VMT at residence TAZ divided by total population in TAZ

VMT includes all travel within 9-county Bay Area plus San Joaquin County plus estimates of travel distances beyond the 10-county model area

TAZs with zero values (white) did not have population in the 2020 model

0 1 2 3 4 Miles

Intersection Summary	
HCM 6th Ctrl Delay	107.4
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary	
HCM 6th Ctrl Delay	54.5
HCM 6th LOS	D

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

HCM 6th Ctrl Delay	177.8
HCM 6th LOS	F

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

NOTICE OF PREPARATION FOR A DRAFT ENVIRONMENTAL IMPACT REPORT FOR PLN22-0039, A NEW WAREHOUSE PROJECT AT 880 DOOLITTLE DRIVE, SAN LEANDRO, CALIFORNIA 94577

Date: November 22, 2023

To: State Clearinghouse and Interested Parties and Organizations

Project Title: 880 Doolittle Drive Industrial Project

Lead Agency: City of San Leandro
Community Development Department
835 East 14th Street
San Leandro, California 94577

Contact: Cindy Lemaire, AICP, CNU-A, Senior Planner, Community Development Department

Public Review Period: November 22, 2023 through December 22, 2023, 2023 (30 days) in accordance with CEQA Guidelines Section 15082

Purpose of the Notice

The intent of this Notice of Preparation (NOP) is to inform agencies and interested parties that the City of San Leandro (City) is preparing a Draft Environmental Impact Report (EIR) for the proposed 880 Doolittle Drive Industrial Project in accordance with California Environmental Quality Act (CEQA) Guidelines Section 15082. This NOP provides information about the project and its potential environmental effects and requests that comments be provided on the scope and content of the Draft EIR.

Project Location

The project site is located at 880 Doolittle Drive, which is on the east side of Doolittle Drive just east of adjacent properties with frontage on Doolittle Drive, approximately 0.2 mile north of its intersection with Davis Street, in San Leandro, California. The intersection of Davis Street and Doolittle Drive is the nearest roadway intersection to the project. The project site is approximately 14.14 acres and consists of two Assessor's parcels: APN 77A-0741-004-02 and 77A-0741-005-00. Existing access to the project site is from a driveway on Doolittle Drive (State Route 61) and from a driveway at the southern terminus of Hester Street, north of the project site. The project site is included on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5. Figure 1 shows the site location in a regional context. Figure 2 shows an aerial view of the location of the site relative to the surrounding area.

Project Description

The project involves the demolition of existing warehouse buildings on the site, which are currently vacant, and associated surface parking. Following demolition of existing structures and a lot merger, the proposed project would include construction of a new warehouse with supporting office space, site improvements, and landscaping. The proposed warehouse would be approximately 244,573 square feet, comprised of a 229,573 square-foot of warehouse and 15,000 square feet of associated office space. Approximately 10,000 square feet of office space would be provided on the ground floor alongside the warehouse use. The remaining 5,000 square feet of office space would be on a mezzanine level of the warehouse. The maximum building height as proposed is 50 feet with an interior clear height of 40 feet. The warehouse would be served by 64 dock-high loading doors and surface parking. Surface parking as proposed includes 116 standard parking stalls, 57 compact parking stalls, 3 accessible standard stalls, 3 accessible van stalls, 21 electric vehicle charging stations, and 4 clean air/vanpool stalls.

A Conditional Use Permit, Site Plan Review, Height Exception, Building Permit, Grading Permit, a Tree Removal Permit, and a lot merger would be required to implement the project. Figure 3 shows a project concept schematic of the proposed project.

Potential Environmental Effects

An Initial Study will be prepared for the project. The City preliminarily anticipates that the project would have no impact, a less than significant impact, or a less than significant impact with mitigation incorporated for all environmental issue areas evaluated under CEQA except for greenhouse gas emissions, hazards and hazardous materials, noise, and transportation, as well as mandatory findings of significance associated with these issue areas. The Draft EIR will further evaluate the potential project impacts related to these environmental issue areas.

The Draft EIR will describe the reasonably foreseeable and potentially significant adverse effects of the proposed project (both direct and indirect). The Draft EIR will also evaluate the cumulative impacts of the project when considered in conjunction with other related past, present, and reasonably foreseeable future projects. The Draft EIR will identify mitigation to avoid and/or reduce impacts deemed potentially significant, identify a reasonable range of alternatives, and compare the environmental impacts of the alternatives to the impacts of the proposed project. Comments provided in response to the NOP and the results of the ensuing analyses may identify additional environmental topics to be evaluated.

When the Draft EIR is completed, it will be available for review at the City's Community Development Department located at 835 East 14th Street, San Leandro, California.

Providing Comments

At this time, the City is soliciting comments on the scope of the Draft EIR, including potential environmental impacts of the project and alternatives to be considered. This information will be considered when preparing the Draft EIR's discussion of environmental impacts, mitigation measures, and alternatives. Because of time limits mandated by State law, comments must be received no later than 5**:00 p.m. on December 22, 2023**, which ends the 30-day scoping period.

Comments may be submitted by U.S. mail or by email prior to the close of the NOP scoping period.

Mail comments to:

Cindy Lemaire
Community Development Department
City of San Leandro
835 East 14th Street
San Leandro, California 94577

Email comments to Cindy Lemaire at: clemaire@sanleandro.org

For comments submitted via email, please include "NOP Comments: 880 Doolittle Drive Industrial Project" in the subject line and the name and physical address of the commenter in the body of the email.

All comments on environmental issues received during the public scoping period will be considered and addressed in the Draft EIR. This NOP, the Initial Study, and other public review documents for this project will be available for viewing online. These documents will also be available for review at the Community Development Department office at 835 East 14th Street during regular business hours.

For questions regarding this notice, please contact Cindy Lemaire at clemaire@sanleandro.org.

Hi Cindy,

Thank you for sending us the Notice of Preparation for 880 Doolittle Drive. I don't believe the ALUC has anything to say regarding the scoping of the analysis, but I did want to share the following with regards to the Oakland Airport Land Use Compatibility Plan:

- The project site is located primarily in the Outer Approach Zone (Zone 4), where warehouses and distribution facilities are a compatible use. This assumes that there will be at most 100 employees per acre and that at least 20% of the parcel will be vacant land (this includes parking areas).
- Commercial and industrial uses are compatible with the 60 dB CNEL contour, in which 880 Doolittle is located
- With the stated height of 50 feet, the new warehouse should be under the Part 77 surface maximum for the area

- The site is located in the plan's avigation easement zone; a sample avigation easement is located here

Thank you,

olivia ortiz (they/them)

Unless you recognize the sender and have an expectation that the content is safe, it is best to ignore this email and report it to the Helpdesk. Sincerely, Your IT Team

Dear Cindy Lemaire,

We received notice of the **880 Doolittle Drive Industrial Project (Project) Notice of Preparation (NOP)** and wanted to send you relevant recommendations and resources for the development of the Project. As a reminder, the Air District recently updated the California Environmental Quality Act (CEQA) Guidelines (2023), which provides updated screening methodologies, as well as updates to climate impact thresholds to address greenhouse gas (GHG) emissions. The updated Guidelines can be found here: https://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/updated-ceqa-guidelines.

While the Project's impacts have yet to be evaluated, we wanted to provide you resources for reducing air pollutants and minimizing climate impacts, including the most up to date best practices for warehouse projects, especially for projects located in disadvantaged communities (as defined by SB 1000) and within Air District Overburdened Communities (as defined by Air District Regulation 2, Rule 1: General Requirements, Section 2-1-243).

The Air District recommends the Project incorporate all feasible measures to reduce impacts, including the installation of on-site solar arrays, procurement of 100% renewable energy, electrification of all operations to the extent feasible including 'make-ready' electrification infrastructure, and consideration of truck route management to reduce community impacts. Additionally, the Project should incorporate construction mitigation measures, especially for demolition and site preparation that may elevate fugitive dust. More information and examples are available under the 'Resources' section of this email, as well as the Air District's CEQA Guidelines (2023).

Certain aspects of the Project may require a permit from the Air District (for example, backup diesel generators and asbestos demolition). Please ensure the Air District is adequately recognized as a permitting agency in future environmental documents. Permit requirements may be discussed with Barry Young, Senior Advanced Projects Advisor, at (415) 749-4721 or byoung@baaqmd.gov.

Resources:
The first two documents are similar logistics center/warehouse comment letters that describe Air District recommendations. We are also including additional resource links from other agencies and the Attorney General's office that could be useful in the development of this Project.

- BAAQMD CEQA Comment Letter: CenterPoint North Richmond Warehouse Project EIR
- BAAQMD CEQA Comment Letter: Scannell Properties, LLC North Richmond Warehouse Project NOP
- CARB's Concept Paper for the Freight Handbook: Provides practices to minimize community health impacts from warehouses and freight facilities.
- CA Attorney General's Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act: References good neighbor policies, best practices for community engagement, and other requirements such as fully analyzing impacts from truck trips.

Air District staff are available to assist or respond to any queries associated with this Project, and look forward to reviewing the environmental report. Thank you for your time.

Best,

Mark Tang

RE: 880 Doolittle Drive Industrial Project, SCH #2023110597

Dear Ms. Lemaire:

Thank you for the opportunity to provide comments on the Notice of Preparation for the 880 Doolittle Drive Industrial project. While the logistics industry is an important component of our modern economy, warehouses can bring various environmental impacts to the communities where they are located. For example, diesel trucks visiting warehouses emit nitrogen oxide (NO_x)—a primary precursor to smog formation and a significant factor in the development of respiratory problems like asthma, bronchitis, and lung irritation—and diesel particulate matter (a subset of fine particular matter that is smaller than 2.5 micrometers)—a contributor to cancer, heart disease, respiratory illnesses, and premature death.[1] Trucks and on-site loading activities can also be loud, bringing disruptive noise levels during 24/7 operation that can cause hearing damage after prolonged exposure.[2] The hundreds, and sometimes thousands, of daily truck and passenger car trips that warehouses generate can contribute to traffic jams, deterioration of road surfaces, traffic accidents, and unsafe conditions for pedestrians and bicyclists. Depending on the circumstances of an individual project, warehouses may also have other environmental impacts.

To help lead agencies avoid, analyze, and mitigate warehouses' environmental impacts, the Attorney General Office's Bureau of Environmental Justice has published a document containing best practices and mitigation measures for warehouse projects. We have attached a

[1] California Air Resources Board, Nitrogen Dioxide & Health, https://ww2.arb.ca.gov/resources/nitrogen-dioxide-and-health (NOx); California Air Resources Board, Summary: Diesel Particular Matter Health Impacts, https://ww2.arb.ca.gov/resources/summary-diesel-particulate-matter-health-impacts; Office of Environmental Health Hazard Assessment and American Lung Association of California, Health Effects of Diesel Exhaust, https://oehha.ca.gov/media/downloads/calenviroscreen/indicators/diesel4-02.pdf (DPM).

[2] Noise Sources and Their Effects, https://www.chem.purdue.edu/chemsafety/Training/PPETrain/dblevels.htm (a diesel truck moving 40 miles per hour, 50 feet away, produces 84 decibels of sound).

copy of this document to this letter, and it is also available online.[3] We encourage you to consider the information in this document as you prepare the draft environmental impact report for this project.

Priority should be placed on avoiding land use conflicts between warehouses and sensitive receptors and on mitigating the impacts of any unavoidable land use conflicts. However, even projects located far from sensitive receptors may contribute to harmful regional air pollution, so you should consider measures to reduce emissions associated with the project to help the State meet its air quality goals. A distant warehouse may also impact sensitive receptors if trucks must pass near sensitive receptors to visit the warehouse.

The Bureau will continue to monitor proposed warehouse projects for compliance with the California Environmental Quality Act and other laws. We are available to discuss as you prepare the draft environmental impact report and consider how to guide warehouse development in your jurisdiction. Please do not hesitate to contact the Environmental Justice Bureau at ej@doj.ca.gov if you have any questions.

Sincerely,

CHRISTIE VOSBURG
Supervising Deputy Attorney General

RE: NOTICE OF PREPARATION (NOP) OF A DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR) FOR THE 880 DOOLITTLE DRIVE INDUSTRIAL PROJECT DATED NOVEMBER 22, 2023 STATE CLEARINGHOUSE # 2023110597

Dear Cindy Lemaire,

The Department of Toxic Substances Control (DTSC) received a NOP of a DEIR for the 880 Doolittle Drive Industrial Project. The Project involves the demolition of existing warehouse buildings on the site, which are currently vacant, and associated surface parking. Following demolition of existing structures and a lot merger, the proposed Project would include construction of a new warehouse with supporting office space, site improvements, and landscaping. The proposed warehouse would be approximately 244,573 square feet, comprised of 229,573 square-feet of warehouse and 15,000 square feet of associated office space. Approximately 10,000 square feet of office space would be provided on the ground floor alongside the warehouse use. The remaining 5,000 square feet of office space would be on the mezzanine level of the warehouse. The warehouse would be served by 64 dock-high loading doors and

surface parking. Surface parking as proposed includes 116 standard parking stalls, 57 compact parking stalls, 3 accessible standard stalls, 3 accessible van stalls, 21 electric vehicle charging stations, and 4 clean air/vanpool stalls.

Following our review of the Project, DTSC recommends consideration of the following comments:

1. If buildings or other structures are to be demolished on any project sites included in the proposed Project, surveys should be conducted for the presence of lead-based paints or products, mercury, asbestos containing materials, and polychlorinated biphenyl caulk. Removal, demolition, and disposal of any of the above-mentioned chemicals should be conducted in compliance with California environmental regulations and policies. In addition, sampling near current and/or former buildings should be conducted in accordance with DTSC's 2006 Interim Guidance Evaluation of School Sites with Potential Contamination from Lead Based Paint, Termiticides, and Electrical Transformers.
2. DTSC recommends that all imported soil and fill material should be tested to ensure any contaminants of concern are within approved screening levels for the intended land use. To minimize the possibility of introducing contaminated soil and fill material there should be documentation of the origins of the soil or fill material and, if applicable, sampling be conducted to ensure that the imported soil and fill material meets screening levels for the intended land use. The soil sampling should include analysis based on the source of the fill and knowledge of the prior land use.
3. Prior to any new buildings being constructed on site, a Remedial Action Plan (RAP) amendment will be required to evaluate the soil vapor impacts and vapor intrusion risk. While a vapor mitigation system has been discussed for the site, the system cannot be installed before the completion of the RAP amendment.

DTSC believes the City of San Leandro must address these comments to determine if

any significant impacts under the California Environmental Quality Act (CEQA) will occur and, if necessary, avoid significant impacts under CEQA.

DTSC appreciates the opportunity to comment on the 880 Doolittle Drive Industrial Project. Thank you for your assistance in protecting California's people and environment from the harmful effects of toxic substances. If you have any questions or would like any clarification on DTSC's comments, please respond to this letter or via email for additional guidance.

Re: SCH #2023110597 - 880 Doolittle Drive Industrial Project

Dear Ms. Lemaire:

The California Department of Transportation, Aeronautics Program has reviewed the Notice of Preparation of a Draft EIR for the project 880 Doolittle Drive Industrial Project. One of the goals of the California Department of Transportation (Caltrans), Aeronautics Program, is to assist cities, counties, and Airport Land Use Commissions or their equivalent (ALUC), to understand and comply with the State Aeronautics Act pursuant to the California Public Utilities Code (PUC), Section 21001 et seq. Caltrans encourages collaboration with our partners in the planning process and thanks you for including the Aeronautics Program in the review of the Notice of Preparation.

The proposed Project site is primarily in Safety Zone 4 (Outer Approach/Departure Zone), with a portion in Zone 6 (Traffic Pattern Zone) of the Oakland International Airport and therefore must adhere to the safety criteria and restrictions defined in the Airport Land Use Compatibility Plan (ALUCP) formed by the ALUC pursuant to the PUC, Section 21674. Warehouse and office space square footage per person should be further reviewed to adhere to consistency with the ALUCP and Table 3-2 of the ALUCP. Section 3.3.2.7. should also be reviewed to ensure compatibility with development criteria.

In addition, as the project site is included on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5, compatibility restrictions should be reviewed per the ALUCPs Table 3-2 and Section 3.3.2.8(e).

The proposed project may also be subject to 14 CFR Part 77 Conical Surface standards and CNEL Contours noise compatibility in applicable areas.

Caltrans advises the City of San Leandro to submit its plans to the ALUC to determine if the plans or projects are consistent or not with the ALUCP according to the State

Aeronautics Act's statutory procedure. An ALUCP is crucial in minimizing noise nuisance and safety hazards around airports while promoting the orderly development of airports, as declared by the California Legislature. A responsibility of the ALUC is to assess potential risk to aircraft and persons in airspace and people occupying areas within the vicinity of the airport.

If you have any questions or need additional information, please contact me at my email address: tiffany.martinez@dot.ca.gov.

Sincerely,

Tiffany Martinez

Re: 880 Doolittle Drive Industrial Project – Notice of Preparation (NOP) for a Draft Environmental Impact Report (DEIR)

Dear Cindy Lemaire:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the 880 Doolittle Drive Industrial Project. We are committed to ensuring that impacts to the State's multimodal transportation system and to our natural environment are identified and mitigated to support a safe, sustainable, integrated and efficient transportation system.

The Local Development Review (LDR) Program reviews land use projects and plans to ensure consistency with our mission and state planning priorities. The following comments are based on our review of the November 2023 NOP.

Project Understanding
The proposed project is in the vicinity of State Route (SR)-61 and SR-112 in San Leandro. The project would demolish currently vacant warehouse buildings on the site and construct a new 229,573-square-foot warehouse with supporting office space, site improvements, and landscaping.

Freight
Please consider the following freight issues when drafting the DEIR: the number of parking spaces should be based on peak operating time of the activity generator; site entrance and exit points should accommodate the design of vehicle movements; the DEIR should identify pedestrian and bicycle conflict points to and from the proposed facility as well as bus stops that may conflict with truck parking zones; and the project

should consider the number of legal truck parking spots available in the area and the potential areas that may be utilized as unauthorized parking.

In addition, the City may consider implementing the following improvements to the project: providing peak operating time parking to ensure an adequate number of spaces; and implementing appropriate lighting at loading docks and parking spots to improve safety.

Construction-Related Impacts
Potential impacts to the State Right-of-Way (ROW) from project-related temporary access points should be analyzed. Mitigation for significant impacts due to construction and noise should be identified. Project work that requires movement of oversized or excessive load vehicles on State roadways requires a transportation permit that is issued by Caltrans. To apply, please visit Caltrans Transportation Permits *(link)*. Prior to construction, coordination may be required with Caltrans to develop a Transportation Management Plan (TMP) to reduce construction traffic impacts to the State Transportation Network (STN).

Lead Agency
As the Lead Agency, the City of San Leandro is responsible for all project mitigation, including any needed improvements to the STN. The project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should be fully discussed for all proposed mitigation measures.

Thank you again for including Caltrans in the environmental review process. Should you have any questions regarding this letter, please contact Llisel Ayon, Associate Transportation Planner, via LDR-D4@dot.ca.gov. For future early coordination opportunities or project referrals, please contact LDR-D4@dot.ca.gov.

Sincerely,

YUNSHENG LUO
Branch Chief, Local Development Review
Office of Regional and Community Planning

Re: Notice of Preparation for a Draft Environmental Impact Report for the 880 Doolittle Drive Industrial Project (PLN22-0039), San Leandro

Dear Ms. Lemaire:

East Bay Municipal Utility District (EBMUD) appreciates the opportunity to comment on the Notice of Preparation (NOP) of a Draft Environmental Impact Report (EIR) for the 880 Doolittle Drive Industrial Project located in the City of San Leandro (City). EBMUD has the following comments.

WATER SERVICE

EBMUD's Central Pressure Zone, with a service elevation range between 0 and 100 feet, will serve the proposed development. Individual units in a newly built multi-occupancy commercial/industrial premises shall be individually metered. A main extension, at the project sponsor's expense, may be required to serve the proposed development depending on water and private fire service metering locations and fire flow requirements set by the local fire agency. Please see the attached EBMUD documents for California (Waterworks Standards) Code of Regulations, Title 22, Section 64572 (Water Main Separation) and EBMUD requirements for placement of water mains. When the development plans are finalized, the project sponsor should contact EBMUD's New Business Office and request a water service estimate to determine costs and conditions for providing water service to the project. Engineering and installation of water mains and services require substantial lead time, which should be provided for in the project sponsor's development schedule.

EBMUD's Standard Site Assessment indicates the potential for contaminated soils or groundwater to be present within the project site boundaries. The project sponsor should be aware that EBMUD will not install piping or services in contaminated soil or groundwater (if groundwater is present at any time during the year at the depth piping is to be installed) that must be handled as a hazardous waste or that may be hazardous to the health and safety of construction and maintenance personnel wearing Level D personal protective equipment. Nor will EBMUD install piping or services in areas where groundwater contaminant concentrations exceed specified limits for discharge to the sanitary sewer system and sewage treatment plants. The project sponsor must submit copies to EBMUD of all known information regarding soil and groundwater quality within or adjacent to the

project boundary and a legally sufficient, complete, and specific written remediation plan establishing the methodology, planning and design of all necessary systems for the removal, treatment, and disposal of contaminated soil and groundwater.

EBMUD will not design piping or services until soil and groundwater quality data and remediation plans have been received and reviewed and will not start underground work until remediation has been carried out and documentation of the effectiveness of the remediation has been received and reviewed. If no soil or groundwater quality data exists, or the information supplied by the project sponsor is insufficient, EBMUD may require the project sponsor to perform sampling and analysis to characterize the soil and groundwater that may be encountered during excavation. Alternatively, EBMUD may perform such sampling and analysis at the project sponsor's expense. If evidence of contamination is discovered during EBMUD's work on the project site, work may be suspended until such contamination is adequately characterized and remediated to EBMUD's standards.

WATER CONSERVATION

The project presents an opportunity to incorporate water conservation measures. EBMUD requests that the City include in its conditions of approval a requirement that the project sponsor comply with Assembly Bill 325, "Model Water Efficient Landscape Ordinance," (Division 2, Title 23, California Code of Regulations, Chapter 2.7, Sections 490 through 495). The project sponsor should be aware that Section 31 of EBMUD's Water Service Regulations requires that water service shall not be furnished for new or expanded service unless all the applicable water-efficiency measures described in the regulation are installed at the project sponsor's expense.

If you have any questions concerning this response, please contact Timothy R. McGowan, Senior Civil Engineer, Major Facilities Planning Section at (510) 287-1981.

Sincerely,

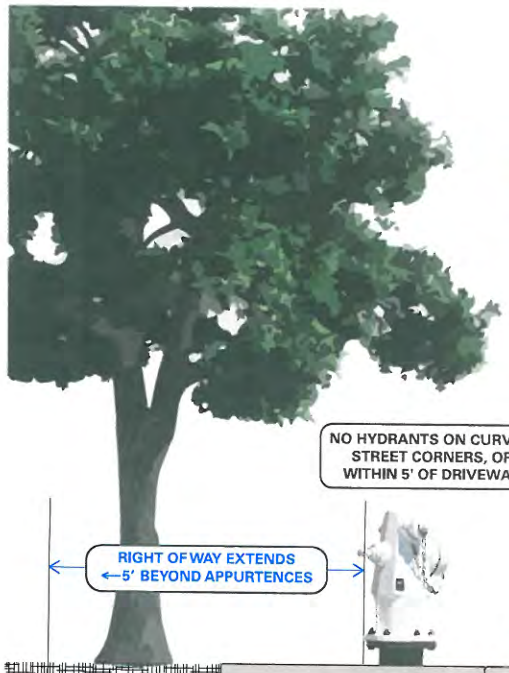
David J. Rehnstrom
Manager of Water Distribution Planning

DJR:EZ:kn
wdpd23_241 880 Doolittle Drive Industrial Project

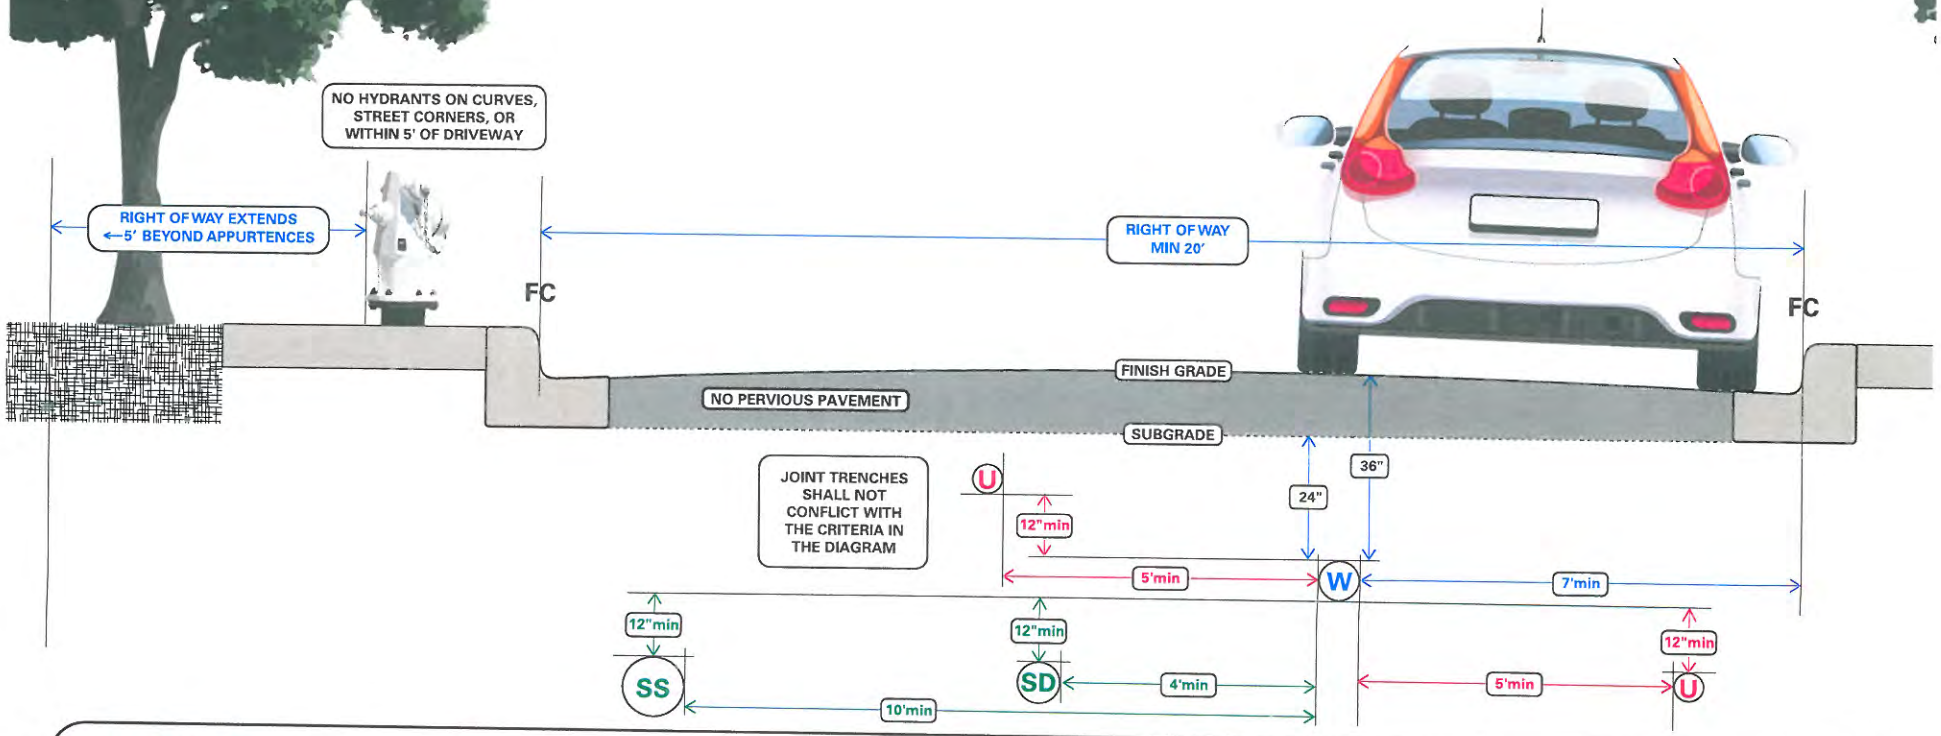
Attachment Applicant Pipeline Design Criteria

EAST BAY
MUNICIPAL UTILITY DISTRICT

Applicant Pipeline Design Criteria



EBMUD values applicant pipeline projects and is committed to providing a thorough and efficient design. To ensure an efficient design process and to avoid significant delays the design criteria below should be adhered to when submitting improvement plans.



Design Criteria

- Water mains shall be seven (7) feet from face of curb.
- Water mains shall maintain a minimum one (1) foot vertical and five (5) foot horizontal clearance from other utilities.
- Gas mains shall meet the one (1) foot vertical separation requirement by installing the gas main below the water main only.
- Water mains shall maintain a minimum ten (10) foot horizontal clearance (O.D. to O.D.) and be located a minimum one (1) foot above any sewer main. Title 22 CCR
- Water mains shall maintain a minimum four (4) feet horizontal clearance (O.D. to O.D.) and be located a minimum one (1) foot above any storm drain. Title 22 CCR
- Water mains shall have a 36-inch cover to final grade and 24-inch cover to pavement subgrade.
- Joint trenches that are in conflict with the criteria above may delay the project. Submit to EBMUD final joint trench plans (no intent plans) which include the size of the joint trench and the utilities located inside.
- Water mains shall not be installed under pervious pavement.
- Water mains installed under decorative pavement, pavers, or stamped concrete will require an additional paving agreement.
- Hydrants shall not be located on curved sections of street, street corners, or within five feet of a driveway.
- Right of ways for 6-inch and 8-inch water mains shall be a minimum of 20 feet wide and extend five (5) feet past the water main centerline.
- Right of ways for 12-inch to 24-inch water mains shall be a minimum of 20 feet wide and extend eight (8) feet past the water main centerline.

Please contact the New Business Office representative assigned to your project if there are any questions regarding the requirements listed above. Meeting this criteria will enable the most efficient design possible.

APPLICANT PIPELINE DESIGN CRITERIA

W = WATER
24" cover to subgrade
36" cover to final grade

Re: 2023110597, 880 Doolittle Drive Industrial Project, Alameda County

Dear Ms. Lemaire:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

a. A brief description of the project.

b. The lead agency contact information.

c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).

d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

a. Alternatives to the project.

b. Recommended mitigation measures.

c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

a. Type of environmental review necessary.

b. Significance of the tribal cultural resources.

c. Significance of the project's impacts on tribal cultural resources.

d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

a. Whether the proposed project has a significant impact on an identified tribal cultural resource.

b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (https://ohp.parks.ca.gov/?page_id=30331) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
    a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
    b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
    a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
    b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
    c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Cody.Campagne@nahc.ca.gov.

1. INTRODUCTION

The following transportation impact analysis (TIA) has been prepared to determine potential Vehicle Miles Traveled (VMT) impacts and/or Level of Service (LOS) deficiencies associated with the proposed 880 Doolittle Drive project ("Project") in the City of San Leandro, CA. The project proposes to redevelop the existing building to become a warehousing and distribution spec building totaling 239,573 square feet.

Figure 1 illustrates the location of the project site in relation to the adjacent roadway network. The site would be accessed by an unsignalized full access driveway along Doolittle Drive and an unsignalized full access driveway along Hester Street. The Project site plan is presented in **Figure 2**.

This TIS was prepared to address the Project's VMT and LOS effects in order to assist the City of San Leandro ("City") with planning and the identification of conditions of approval and to mitigate the Project's VMT impacts or improve identified LOS deficiencies, if necessary. The following discusses the methodology, analysis, and results of the traffic assessment.

STUDY METHODOLOGY

VEHICLE MILES TRAVELED (VMT)

With the passage of SB 743, Vehicle Miles Traveled (VMT) has become an important indicator for determining if a new development will result in a "significant transportation impact" under the California Environmental Quality Act (CEQA). This report summarizes the VMT analysis and resultant findings for the proposed development.

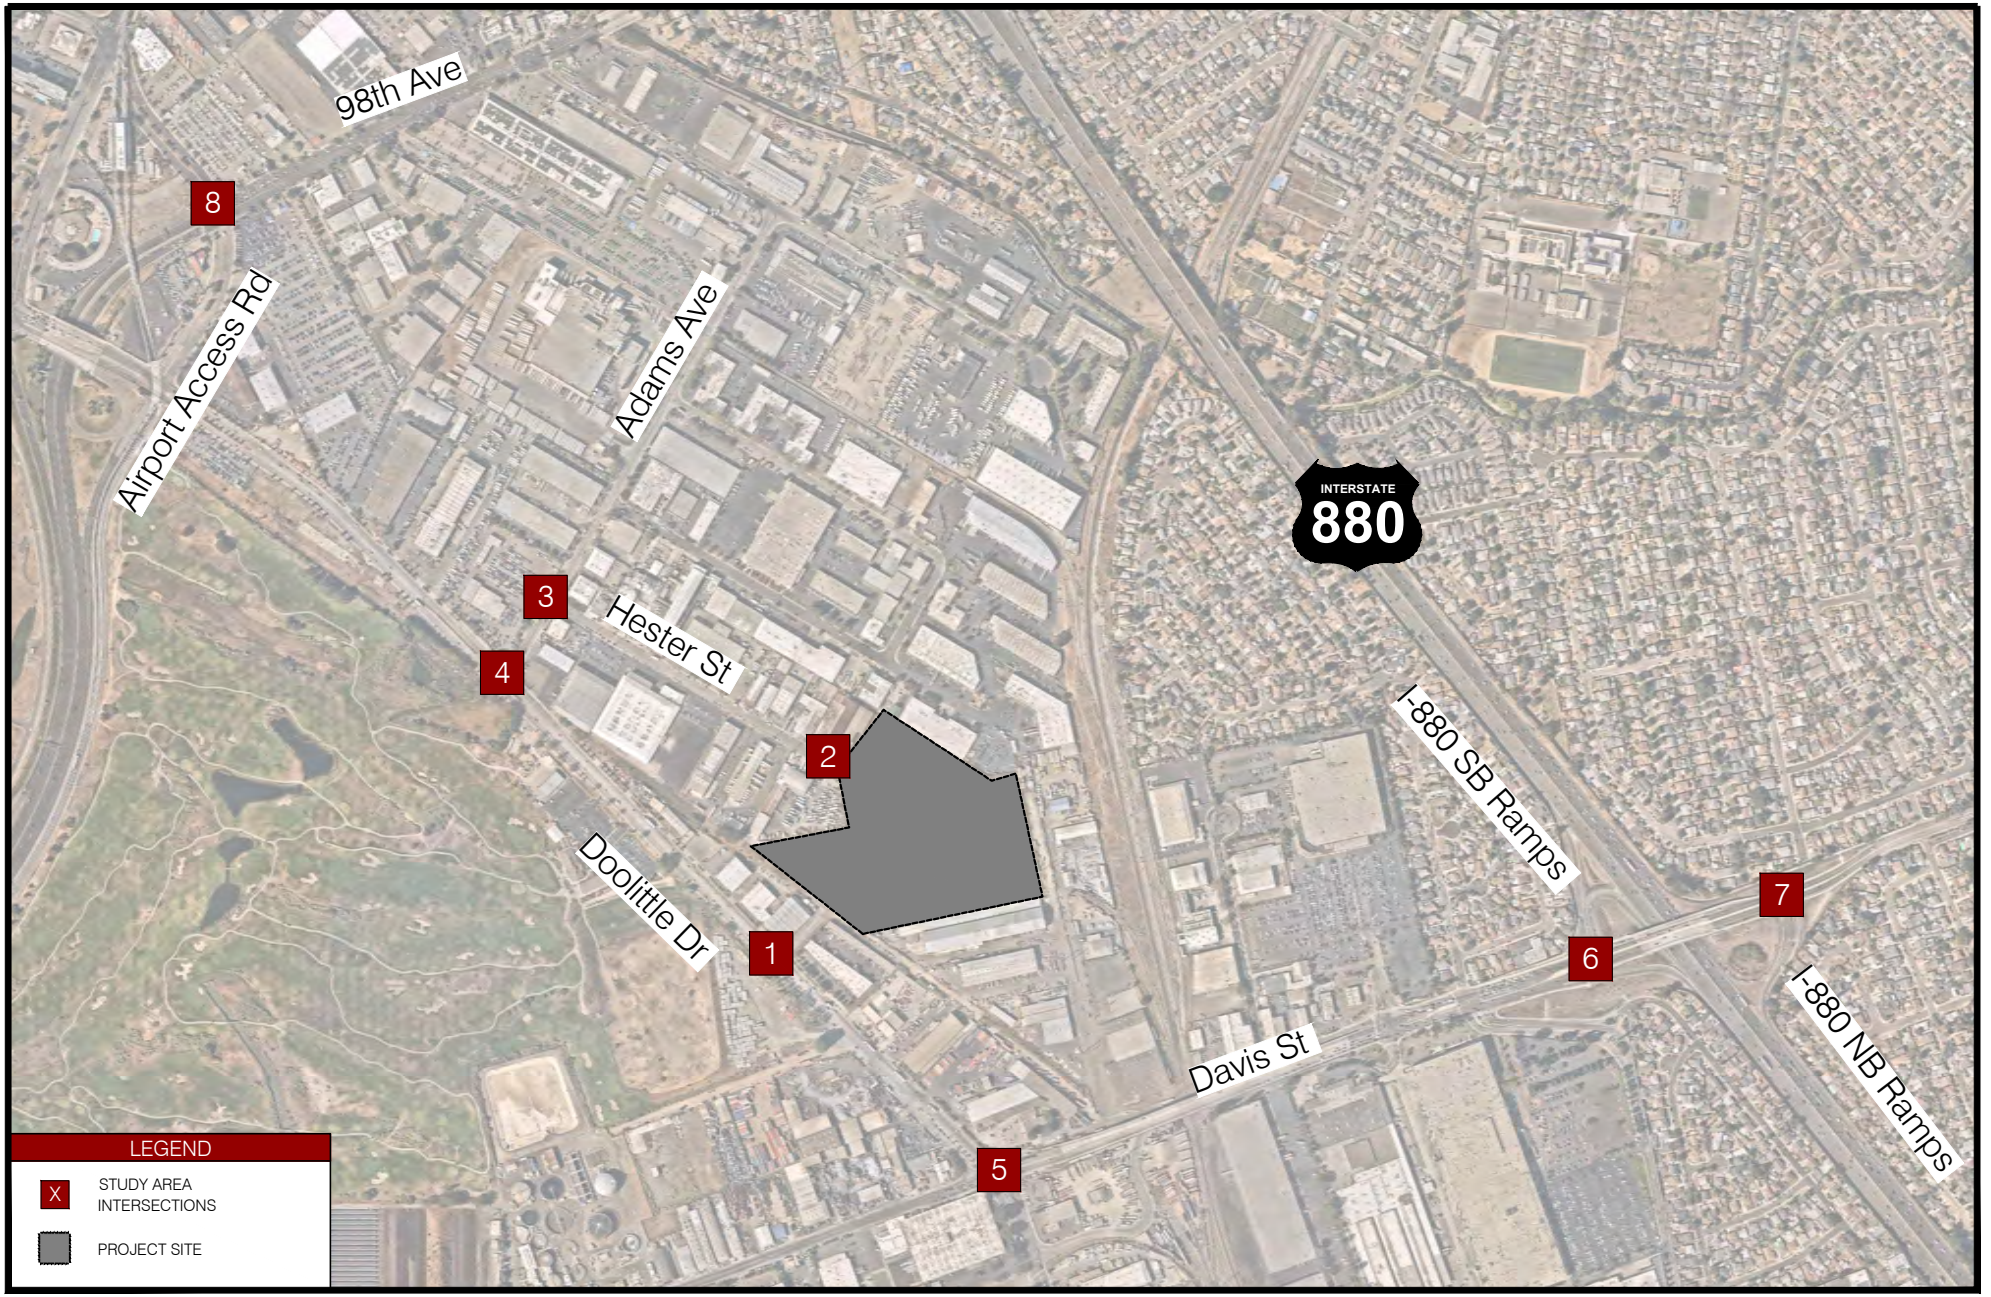
The Alameda County Transportation Commission (ACTC) was developed to implement transportation programs and project across Alameda County. One of its responsibilities is to develop and manage the Countywide travel demand model, which is used for estimating future volumes and VMT based on future land uses and the future roadway network. ACTC has developed maps displaying estimates of VMT per employee based on traffic analysis zone (TAZ) estimates from the Alameda Countywide Travel Demand Model that were used to determine if the project would cause a significant impact.

The City does not have a specified VMT criteria, and therefore per guidance provided by the Governor's Office of Planning and Research (OPR) *Technical Advisory on Evaluating Transportation Impacts in CEQA*, the threshold for employment-based VMT uses is set at 15 percent below the regional average.

TRAFFIC OPERATIONS ANALYSIS

A transportation impact analysis was conducted to evaluate the Project's effect on LOS operations at eight (8) intersections within the project site and adjacent to the project site.

Study Area



The proposed project will generate new vehicular trips that may increase traffic volumes on the nearby street network. To assess changes in traffic conditions associated with the proposed project, the following intersections listed below were evaluated and are shown in **Figure 1**. The study intersections were selected based on the estimated vehicle trips generated by the project and the distribution of the trips to the roadway network.

1. Doolittle Drive and West Project Driveway – Unsignalized
2. Hester Street and North Project Driveway – Unsignalized
3. Hester Street and Adams Avenue – Unsignalized
4. Doolittle Drive and Adams Avenue – Signalized
5. Doolittle Drive and Davis Street – Signalized
6. Davis Street and SB I-880 Ramps – Signalized
7. Davis Street and NB I-880 Ramps – Signalized
8. Airport Access Road and 98th Avenue – Signalized

Analysis Scenarios

This traffic analysis evaluated the following five (5) scenarios:

- Existing Conditions – Based on Existing (2020) traffic counts from the *880 Doolittle Traffic Analysis* prepared by Urban Crossroads in October 2021 shown in **Appendix A**, and existing roadway geometry and traffic control in 2022. Existing (2020) counts were adjusted to the current Existing year (2022) by increasing the volumes by 0.772 percent per year (compounded annually). Trips from the existing site were removed to reflect the vacancy in 2023 conditions. This annual growth rate used in the Urban Crossroads study is based on the average Association of Bay Area Governments (ABAG) projected growth for employment, population, and households for San Leandro.
- Near Term Conditions – Based on adjusted existing traffic volumes, ambient growth along major roadways, and traffic generated by approved developments in the study area. This scenario is based on the roadway geometry and traffic control assumed for year 2024.
- Near Term Plus Project Conditions – Based on traffic generated by the proposed project added to Near Term traffic volumes. This scenario is based on the roadway geometry and traffic control assumed for year 2024.
- Cumulative Conditions – Based on future year traffic forecasts from the Alameda County Transportation Commission (ACTC) travel demand model. This scenario is based on the roadway geometry and traffic control assumed for year 2040.
- Cumulative Plus Project Conditions – Based on traffic generated by the proposed project added to Cumulative traffic volumes. This scenario is based on the roadway geometry and traffic control assumed for year 2040.

Level of Service Standards

Analysis of the study intersections were based on the concept of Level of Service (LOS) and is a qualitative measure used to describe operational conditions. LOS ranges from A (best), which represents minimal delay, to F (worst), which represents heavy delay and a facility that is operating at or near its functional capacity. Levels of service for this study were determined using methods defined in the *Highway Capacity Manual, 6th Edition* (HCM 6) and *Highway Capacity Manual, 2000* (HCM 2000) within Synchro analysis software. Intersections with standard signal phasing were analyzed with HCM 6. Intersections with non-standard signal phasing or non-standard intersection control were analyzed using HCM 2000 methodologies due to HCM 6 methodology limitations within Synchro. This analysis was prepared based on the standards and methodologies set forth by the City of San Leandro (City).

It should be noted that recent changes to the California Environmental Quality Act (CEQA) now recognizes vehicle miles traveled (VMT) as the primary standard of review for project impacts and is no longer based on intersection delay and LOS. Therefore, the LOS evaluation is provided for informational purposes only and to document the operational changes as a result of the project. The VMT evaluation has been provided in Chapter 4.

The HCM includes procedures for analyzing side street stop controlled (SSSC) and signalized intersections. The SSSC procedure defines LOS as a function of average control delay for the worst approach. Conversely, the signalized intersection procedures define LOS as a function of average control delay for the intersection as a whole. **Table 1** relates the operational characteristics associated with each LOS category for signalized and unsignalized intersections.

Table 1 – Intersection Level of Service Definitions

Level of Service	Description	Signalized (Avg. control delay per vehicle sec/veh.)	Unsignalized (Avg. control delay per vehicle sec/veh.)
A	Free flow with no delays. Users are virtually unaffected by others in the traffic stream	≤ 10	≤ 10
B	Stable traffic. Traffic flows smoothly with few delays.	> 10 – 20	> 10 – 15
C	Stable flow but the operation of individual users becomes affected by other vehicles. Modest delays.	> 20 – 35	> 15 – 25
D	Approaching unstable flow. Operation of individual users becomes significantly affected by other vehicles. Delays may be more than one cycle during peak hours.	> 35 – 55	> 25 – 35
E	Unstable flow with operating conditions at or near the capacity level. Long delays and vehicle queuing.	> 55 – 80	> 35 – 50
F	Forced or breakdown flow that causes reduced capacity. Stop and go traffic conditions. Excessive long delays and vehicle queuing.	> 80	> 50

Sources: Transportation Research Board, Highway Capacity Manual 6th Edition, National Research Council, 2016.

The LOS standards as outlined in the City of San Leandro General Plan[1] is LOS D. The City does not have a written significant impact criteria. Based on the *880 Doolittle Traffic Analysis* by Urban Crossroads, dated October 2021, a project would create a deficiency under the following conditions:

- When a study intersection operates at an acceptable LOS for without project conditions and the addition of project trips causes the intersection to operate at an unacceptable LOS.
- When a study intersection operates at an unacceptable LOS for without project conditions and the addition of project trips causes the intersection volume-over-capacity ratio (v/c) to increase by 0.05 or more.

Queuing

The effects of vehicle queuing were analyzed and the 95th percentile queue is reported for all study intersections. The 95th percentile queue length represents a condition where 95 percent of the time during the peak hour, traffic queues will be less than or equal to the queue length determined by the analysis. This is referred to as the "95th percentile queue." Average queuing is generally less.

Queues that exceed the turn pocket length can create potentially hazardous conditions by blocking through traffic in adjacent travel lanes. The City does not have standards for queuing. For the purpose of this analysis, queuing deficiencies would be considered as operational issues and were considered to occur under conditions where project traffic causes the queue to extend beyond the turn pocket by 25 feet or more (i.e., the length of one vehicle) into adjacent traffic lanes that operate separately from the left or right turn lane. Where the vehicle queue already exceeds that turn pocket length under pre-project conditions, a queuing deficiency would occur if project traffic lengthened the queue by 25 feet or more.

REPORT ORGANIZATION

The remainder of the report is divided into the following chapters:

- Chapter 2: Existing Conditions – describes existing conditions on the roadway network.
- Chapter 3: Project Description – describes the project including project trip generation, distribution, and assignment.
- Chapter 4: Vehicles Miles Traveled – describes the Project's Vehicle Miles Traveled (VMT) methodology, analysis, and results.
- Chapter 5: Traffic Operations Analysis – describes intersection level of service analysis, roadway level of service, and intersection queuing.
- Chapter 6: Alameda County Transportation Commission Land Use Analysis Program – describes results of the Alameda CTC Land Use analysis under Year 2020 and Year 2040 Conditions.
- Chapter 7: Site Access and Circulation – describes site access and circulation and parking for the site. This chapters also includes potential effects the proposed project may have on the transit system, pedestrian facilities, and bicycle facilities.
- Chapter 8: Parking – describes the vehicle and bicycle parking for the proposed project, as well as required parking.
- Chapter 9: Conclusion – summarizes potential deficiencies and improvements of the proposed project, if necessary.

[1] *City of San Leandro General Plan, Transportation Element*, City of San Leandro, September 2016

2. EXISTING CONDITIONS

This chapter describes the existing conditions of the roadway network within the vicinity of the project site. The chapter also presents existing turning movement volumes and intersection levels of service.

EXISTING ROADWAY NETWORK

INTERSTATE 880 (I-880)

Interstate 880 (I-880) is a north-south freeway that connects to Interstate 280 and State Route 17 to the south to Interstate 80 and Interstate 580 to the north. Within the study area, the roadway consists of six southbound lanes (including one HOV lane) and four northbound lanes. I-880 serves as regional access to the project site. The posted speed limit on I-880 within the study area is 65 mph.

DOOLITTLE DRIVE

Doolittle Drive is a north-south arterial. It connects to Otis Drive and Fernside Boulevard to the north and Belvedere Avenue to the south. The roadway within the study area is two lanes in each direction and has a center two-way left-turn lane (TWLTL). It serves mainly industrial uses along the corridor. Within the study area, the speed limit on Doolittle Drive is 45 miles per hour.

DAVIS STREET

Davis Street is a four-lane, east-west arterial which runs between Business Center Drive and E 14th Street. The roadway serves residential and commercial uses. Within the study area, the speed limit on Davis Street is 35 miles per hour.

ADAMS AVENUE

Adams Avenue is a two-lane, east-west collector between Doolittle Drive and Bigge Street. The roadway includes Class II bike lanes and on-street parking and serves industrial uses. Within the study area, the speed limit on Adams Avenue is 35 miles per hour.

HESTER STREET

Hester Street is a two-lane, north-south local road connecting to Adams Avenue. The roadway includes on-street parking and serves industrial uses. Within the study area, there is no posted speed limit but given the classification of the road, it is assumed that the speed limit is 25 miles per hour.

AIRPORT ACCESS ROAD

Airport Access Road is a five-lane, minor collector that connects to Bessie Coleman Drive and Hegenberger Road. The roadway provides access to the Oakland International Airport. Within the study area, there is no posted speed limit but given the classification of the road, it is assumed that the speed limit is 35 miles per hour.

98TH AVENUE

98th Avenue is a minor arterial which connects to Bessie Coleman Drive to the west and Golf Links Road to the east. The roadway within the study area consists of six-lanes and serves multiple uses. Within the study area, the posted speed limit is 30 miles per hour.

EXISTING LANE CONFIGURATION AND TRAFFIC CONTROL

Existing intersection lane configuration and traffic controls are illustrated in **Figure 3**.

EXISTING PEAK-HOUR TURNING MOVEMENT VOLUMES

Volumes are based on Existing (2020) traffic counts from the *880 Doolittle Traffic Analysis*[2] prepared by Urban Crossroads in October 2021, and existing roadway geometry and traffic control in 2022. Existing (2020) counts were adjusted to the current Existing year (2022) by growing the volumes by 0.772 percent per year (compounded annually). Trips from the existing site were removed to reflect the vacancy in 2023 conditions. This annual growth rate used in the Urban Crossroads study is based on the average ABAG projected growth for employment, population, and households for San Leandro. Existing peak hour turning movement volumes are shown in **Figure 4.**

3. PROJECT DESCRIPTION

This chapter presents a description of the proposed site use, trip generation, trip distribution, and trip assignment for the proposed project on the transportation system.

PROPOSED SITE USE

The project proposes to redevelop the existing building to become a warehousing and distribution spec building totaling 239,573 square feet. The existing building has been vacant since 2020 (after the counts were taken) and was not occupied during Existing (2023) conditions. Therefore, no existing trip credits were taken.

Figure 1 illustrates the location of the project site in relation to the adjacent roadway network. The site would be accessed by an unsignalized full access driveway along Doolittle Drive and an unsignalized full access driveway along Hester Street. The Project site plan is presented in **Figure 2**.

TRIP GENERATION

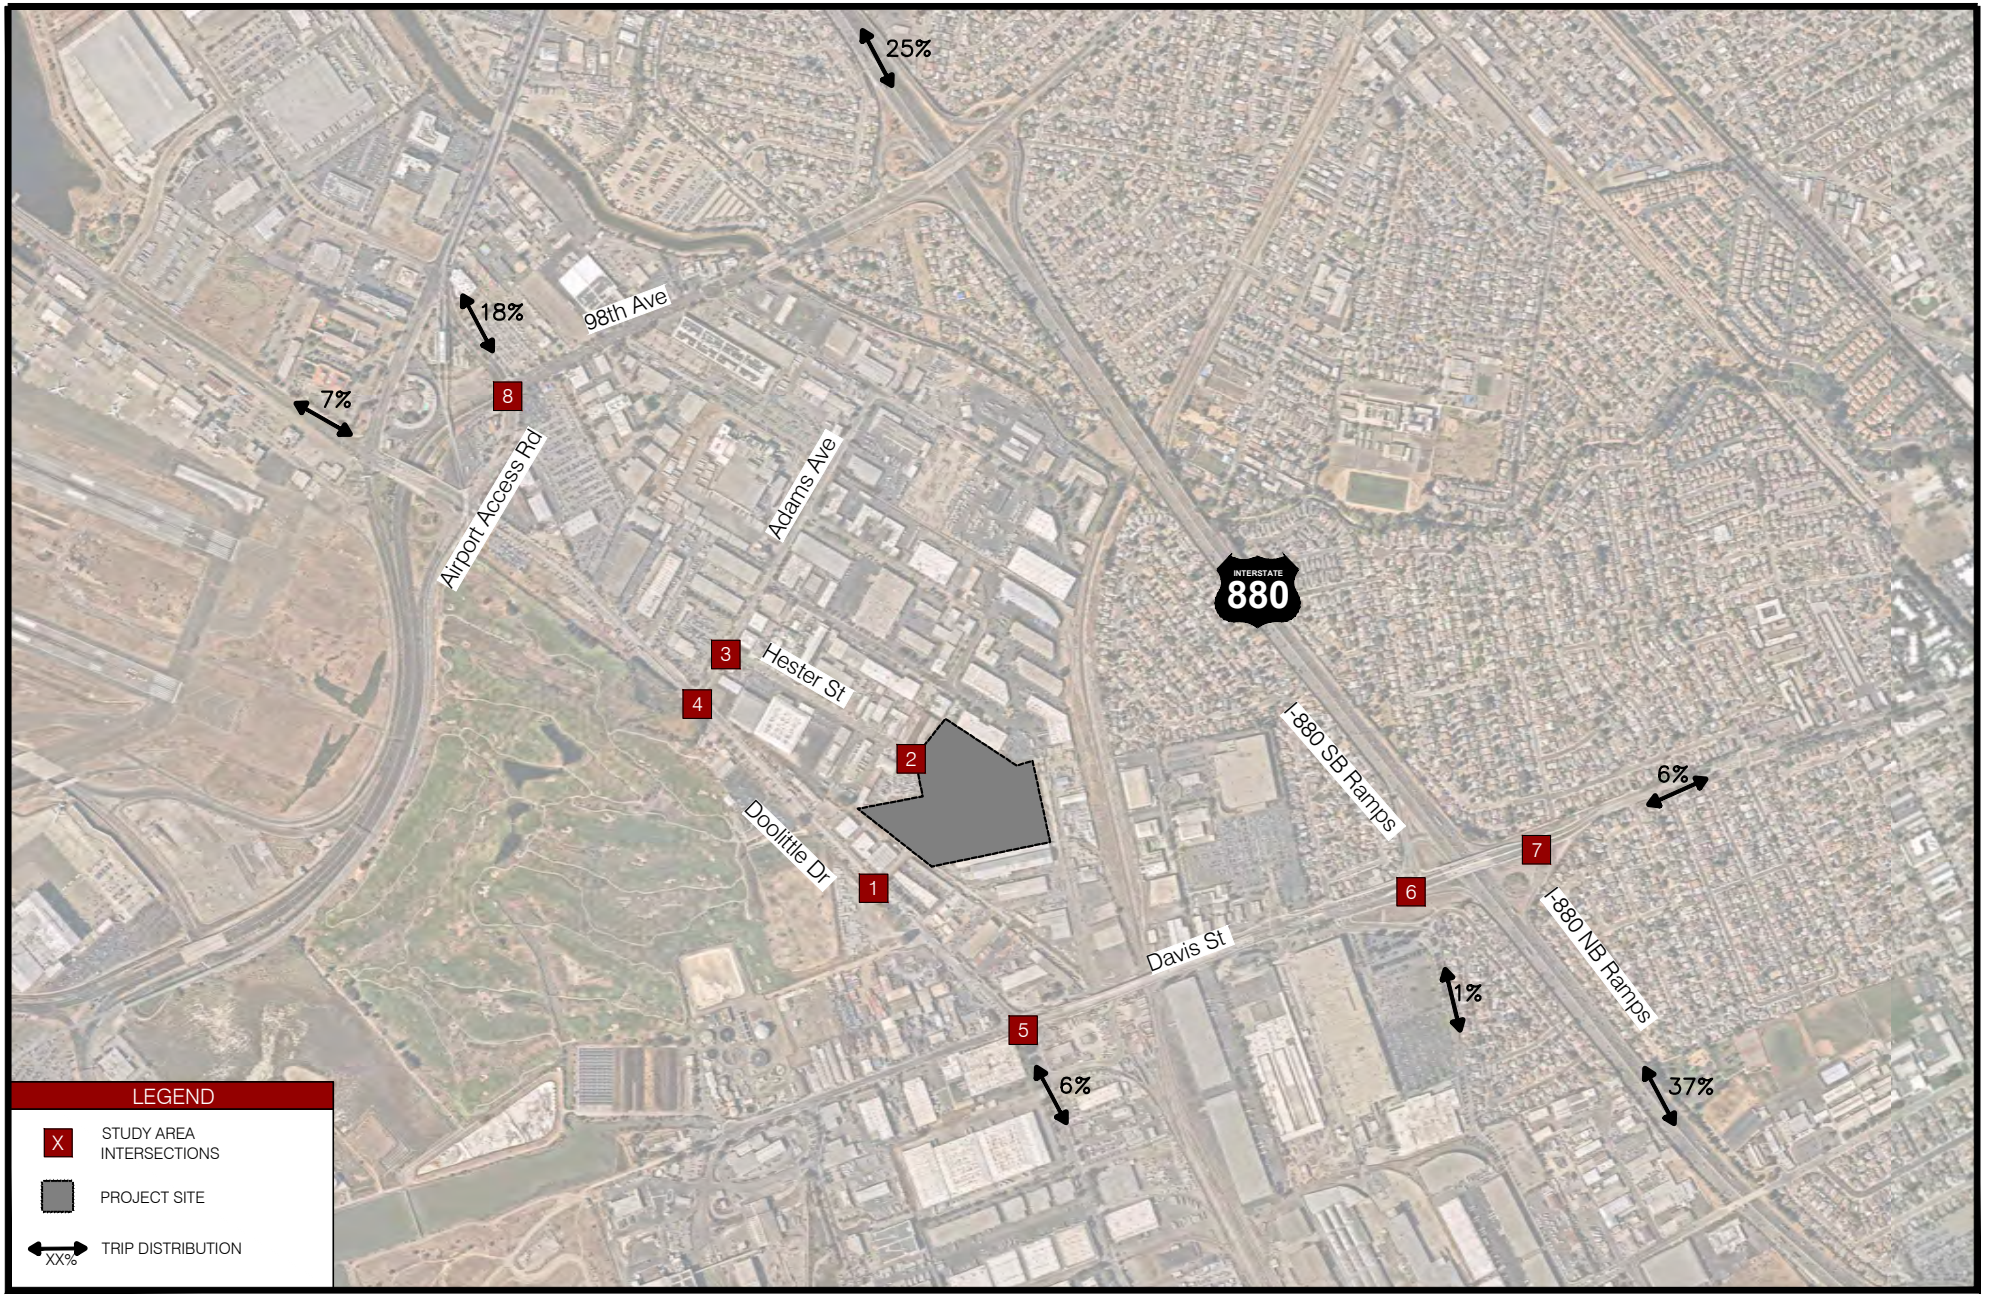
Trip generation for projects are typically calculated based on information contained in the Institute of Transportation Engineer's (ITE) publication, *Trip Generation Manual, 11th Edition*[3]*.* The manual is a standard reference used by jurisdictions throughout the country for the estimation of trip generation of proposed projects. A trip is defined in the *Trip Generation Manual* as a single or one-directional vehicle movement with either the origin or destination at the project site. In other words, a trip can be either "to" or "from" the site and therefore, a single visitor to a site is counted as two.

For purposes of determining the worst-case deficiencies of traffic on the surrounding street network, the trips generated by a proposed project are estimated for the AM peak hour (between the hours of 7:00 AM and 9:00 AM), and for the PM peak hour (between 4:00 PM and 6:00 PM) on a typical weekday. Trips generated by the proposed project were based on the rates for ITE Land Use 155 (High-Cube Fulfillment Center – Sort).

Table 2 presents the trip generation for the proposed project. The project would generate 208 trips in the AM peak hour and 287 trips in the PM peak hour.

[3] *Trip Generation Manual, 11th Edition*, Institute of Transportation Engineers, 2021.

Table 2 – Project Trip Generation



Vehicle Type	Daily	AM Peak Hour (7:00-9:00)			PM Peak Hour (4:00-6:00)		
		In	Out	Total	In	Out	Total
100% ITE (LU 155 Sort) High-Cube Fulfillment Center[2]							
Rates							
Passenger Car	6.25	0.69	0.16	0.85	0.46	0.72	1.18
Truck	0.19	0.01	0.01	0.02	0.01	0.01	0.02
Trips							
Passenger Car	1,497	167	36	203	110	172	282
Truck	46	2	3	5	2	3	5
Total	1,543	169	39	208	112	175	287

[1] Existing trip generation is based on the 880 Doolittle Traffic Analysis prepared by Urban Crossroads in October 2021.
[2] Proposed trip generation based on ITE *Trip Generation Manual, 11th Edition*.

PROJECT TRIP DISTRIBUTION AND ASSIGNMENT

The Project's trip distribution was estimated based on the project access locations, freeway access, and roadway network within the study area. **Figure 5** presents the trip distribution assumed for the Near Term Plus Project and Cumulative Plus Project analysis.

Based on the assumed trip distribution, the volumes generated by the project were assigned to the roadway network. Trip assignment to the project driveways was based on the on-site circulation and available movements for each driveway. **Figure 6** presents the project's AM and PM peak hour trip assignment.

4. VEHICLE MILES TRAVELED (VMT)

This chapter summarizes the Project's Vehicle Miles Traveled (VMT) methodology, analysis, and results.

VMT METHODOLOGY

The City has not yet adopted VMT guidelines or a methodology for determining VMT impacts. Therefore, the Project's VMT evaluation relied on guidance provided by the Governor's Office of Planning and Research (OPR) Technical Advisory on Evaluating Transportation Impacts in CEQA[4] to determine potential impacts under Senate Bill (SB) 743. It should be noted that the ACTC VMT tools and maps are consistent with OPR methodology and the recommended 15 percent below regional average threshold. The approach outlined by the OPR Technical Advisory does not specifically address industrial facilities. However, for the purposes of this analysis, it is assumed that the employee VMT for this Project would have a similar VMT as an employee for an office use. Therefore, the Project was analyzed as an office project, which is evaluated based on VMT per employee since the predominant driver of VMT for the proposed Project would be commute trips and other employee-based trips. This approach is consistent with OPR guidelines which states, "where methodologies exist that can estimate the full extent of vehicle miles traveled from a project, the lead agency should apply them to do so".

VMT ANALYSIS

The ACTC has developed maps displaying estimates of VMT per employee based on traffic analysis zone (TAZ) estimates from the Alameda Countywide Travel Demand Model. Based on the VMT per Employee map for the Central Planning Area shown in **Appendix B**, the project is located in an area with a VMT equal to 15.34 in 2020 and 16.08 in 2040.

Based on the VMT per Employee map for the Central Planning Area in year 2020 provided by the ACTC, the project is located in an area with a VMT equal to 15.34. The target VMT, which is 15 percent below the average, for Central Planning Area is 16.3. Since the proposed project VMT does not exceeds the Central Planning Area threshold, the project will result in a less than significant VMT impact.

Based on the VMT per Employee table for the Central Planning Area in year 2040 provided by the ACTC, the project is located in an area with a VMT equal to 16.08. The target VMT, which is 15 percent below the average, for Central Planning Area is 16.2. Since the proposed project VMT does not exceeds the Central Planning Area threshold, the project will result in a less than significant VMT impact.

Table 3 summarizes the VMT analysis.

[4] Technical Advisory on Evaluating Transportation Impacts in CEQA, Governor's Office of Planning and Research, December 2018.

Table 3 – VMT Analysis Summary

Category	2020	2040
	Central Planning Area	Central Planning Area
Average VMT per Employee	19.2	19.1
Threshold VMT per Employee (85% of Average)	16.3	16.2
Project TAZ Average VMT per Employee	15.34	16.08
VMT Reduction Percentage Needed	0%	0%

5. TRAFFIC OPERATIONS ANALYSIS

This chapter will discuss the traffic operations analysis that was conducted to determine the effect of the proposed project on the transportation system. The operations analysis includes intersection level of service and intersection queuing.

EXISTING CONDITIONS

Existing conditions represent operations based on the existing roadway configuration (**Figure 3**) and existing volumes (**Figure 4**).

INTERSECTION LEVEL OF SERVICE

Traffic operations were evaluated at the study intersections under existing traffic conditions. Results of the analysis are presented in **Table 4**. All study intersections function within acceptable LOS standards under this analysis scenario except for Intersection #5 – Doolittle Drive and Davis Street in the AM peak hour.

Table 4 – Existing Peak Hour LOS Summary

#	Intersection	LOS Criteria	Jurisdiction	Control[1]	Existing					
					AM Peak			PM Peak

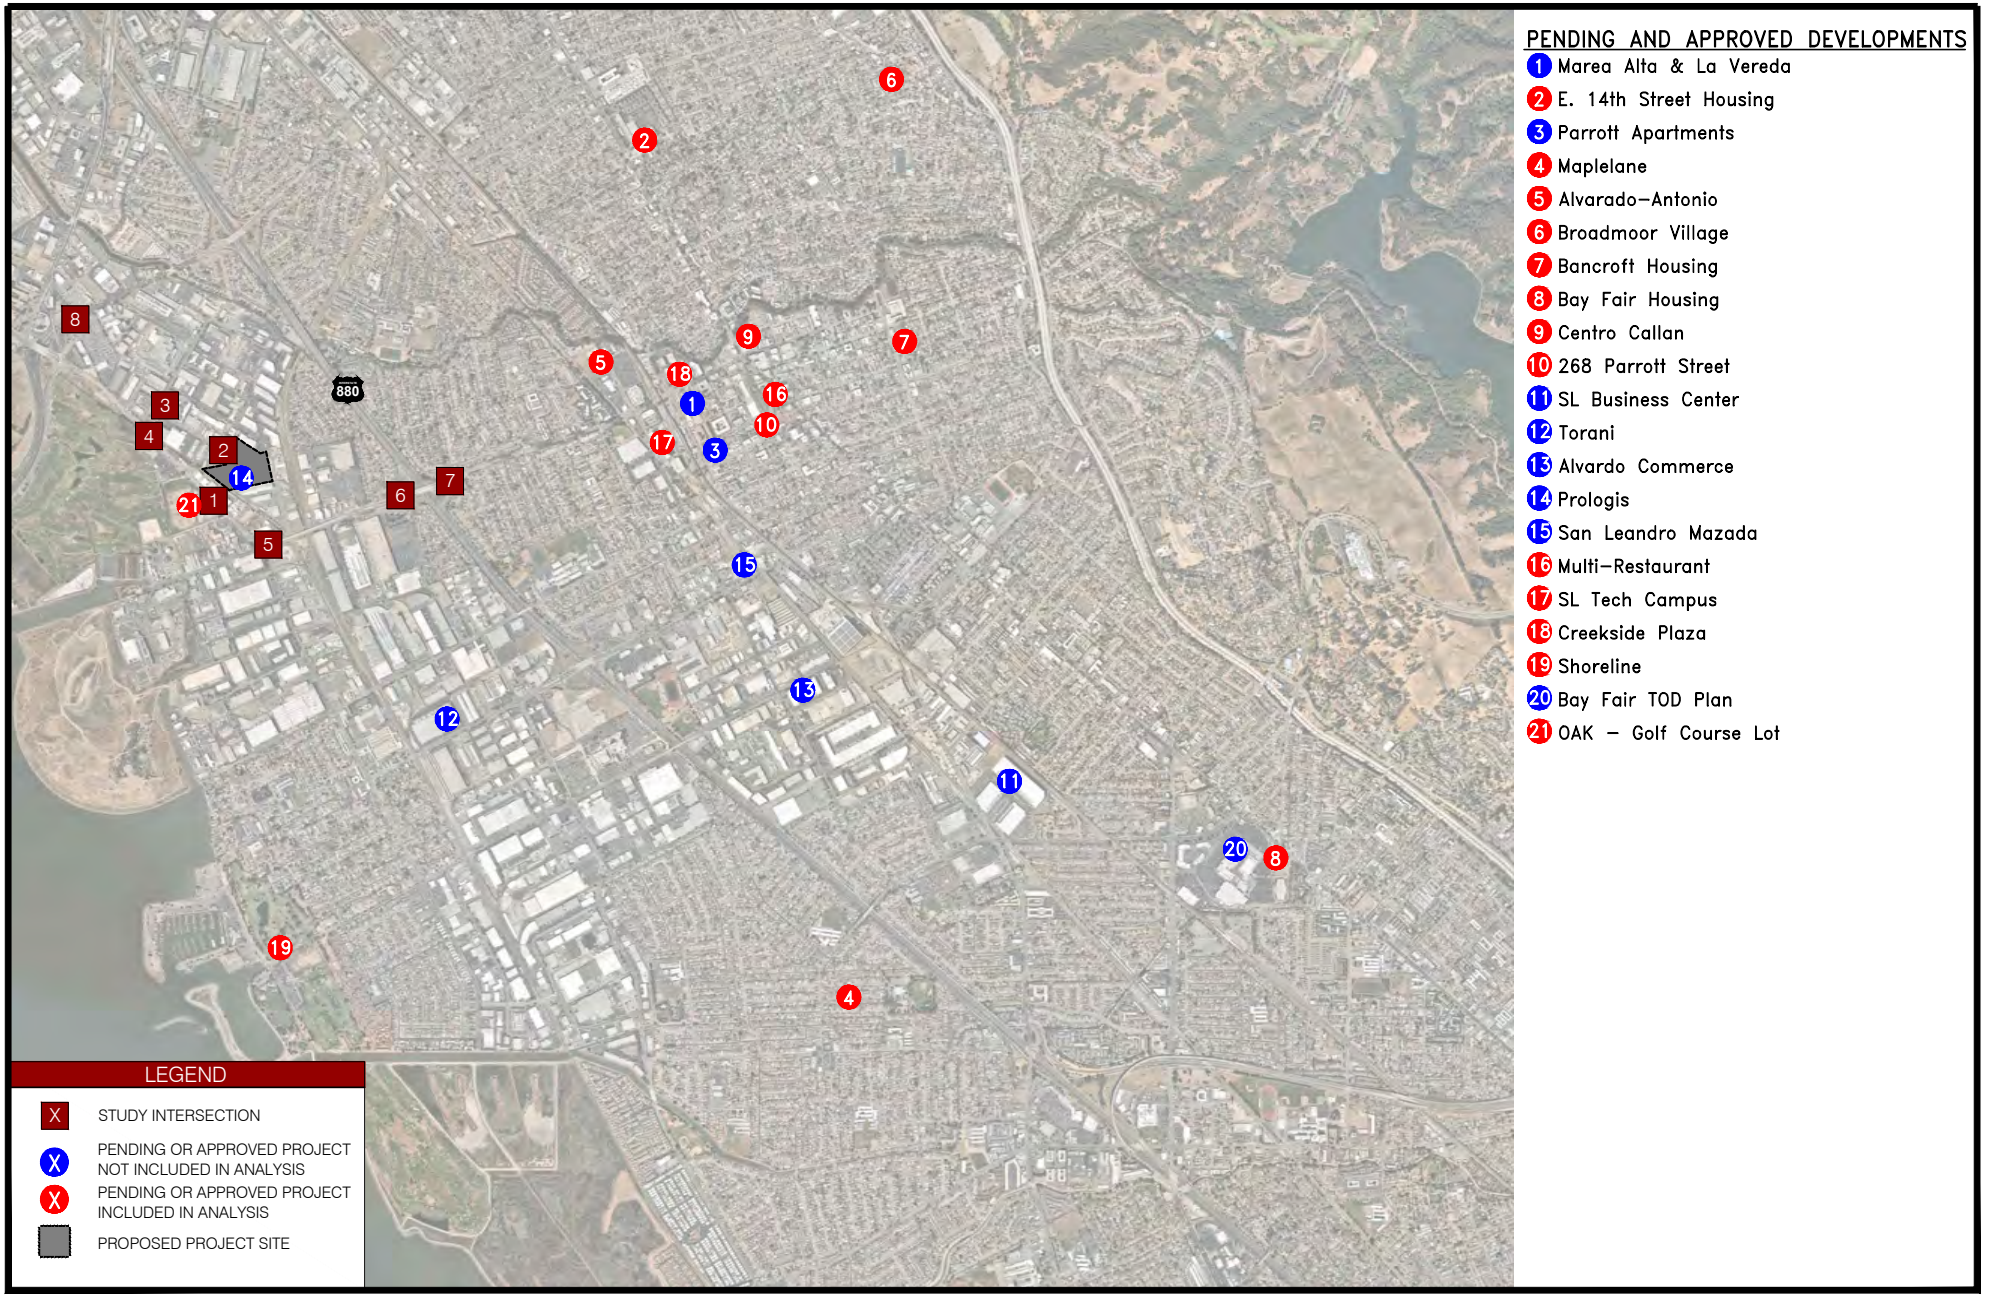
3 Analyzed using HCM 2000 due to non-NEMA phasing.
4 Analyzed using HCM 2000 due to errors with HCM 6 within Synchro 11.

Analysis sheets are provided in **Appendix C**.

NEAR TERM TRAFFIC CONDITIONS

LANE GEOMETRY

Under Near Term conditions, no roadway improvements were assumed, therefore existing lane geometry was assumed as shown in **Figure 3**.



TRAFFIC VOLUMES

At the time of the analysis (November 2022), the San Leandro Developments map and table was downloaded from the City's website and used to determine which projects would be included in the Near Term Conditions. Projects within the vicinity of the project site that were proposed or approved were assumed to be generating vehicle traffic under Near Term Conditions. All pending and approved projects were considered; however, only the projects that would generate a substantial number of trips and were located close enough to affect the study area were included in the analysis. **Figure 7** lists the projects that were included in the Near Term traffic and shows the location of all approved and pending projects. Locations shown in red were included in the analysis and locations shown in blue were considered but not included in the analysis. Specifically, the Oakland Airport Golf Course Parking Lot project was included. Volumes along major arterials such as Doolittle Drive and 98th Avenue were also grown by 0.772 percent per year (compounded annually) to account for trips generated by future developments outside of San Leandro. Pending and approved project volumes are shown in **Figure 8**.

INTERSECTION LEVEL OF SERVICE

Near Term volumes were evaluated at the study intersections and are presented in **Figure 9**. Results are presented in **Table 5**. All study intersections function within acceptable LOS standards under this analysis scenario except for Intersection #5 – Doolittle Drive and Davis Street.

Analysis sheets are provided in **Appendix C**.

NEAR TERM PLUS PROJECT

LANE GEOMETRY AND CONTROL

The project is not proposing any roadway improvements at any study intersection and therefore Near Term Plus Project conditions assumed existing lane geometry as illustrated in **Figure 3**.

TRAFFIC VOLUMES

The Project is estimated to generate a net 497 daily trips, a total of 49 AM peak hour trips (89 inbound and -40 outbound), and 152 PM peak hour trips (55 inbound and 97 outbound). Near Term Plus Project volumes were determined by adding the total project traffic, **Figure 6**, to the Near Term conditions volume, **Figure 9**. Near Term Plus Project peak hour volumes are shown in **Figure 10**.

INTERSECTION LEVEL OF SERVICE

Near Term Plus Project traffic conditions were evaluated at the study intersections. Results are presented in **Table 5**. All study intersections function within acceptable LOS standards under this analysis scenario during the AM and PM peak hours except for Intersection #5 – Doolittle Drive and Davis Street. In the AM peak hour, this intersection deficiency is considered a project deficiency because it operates at an unacceptable LOS for without project conditions and the addition of project trips causes the intersection v/c to increase by 0.05 or more.

Analysis sheets are provided in **Appendix C**.

N

NOT TO SCALE

Kimley»Horn

FIGURE 10
NEAR TERM PLUS PROJECT PEAK HOUR TURNING MOVEMENT VOLUMES

CUMULATIVE TRAFFIC CONDITIONS

LANE GEOMETRY

Under Cumulative conditions, no roadway improvements were assumed, therefore existing lane geometry was assumed as shown in **Figure 3**.

TRAFFIC VOLUMES

To account for future development and growth within the County, the Cumulative traffic volumes were developed by determining a growth rate from the ACTC Model. Existing and future year model outputs were acquired for the roadway links in the study area. These link volumes were then used to determine an annual growth rate that was applied to the Existing volumes. The volumes were reviewed to ensure that there would be no decrease in volumes from Existing or Near Term to the Cumulative year. For locations where the volumes would decrease, they were conservatively assumed to equal the Near Term volume and rounded up to the nearest 10 vehicles. Cumulative peak hour volumes are presented in **Figure 11.**

INTERSECTION LEVEL OF SERVICE

Cumulative volumes were evaluated at the study intersections. Results are presented in **Table 6**. All study intersections function within acceptable LOS standards under this analysis scenario except for Intersection #5 – Doolittle Drive and Davis Street and Intersection #8 – Airport Access Road and 98th Avenue.

Analysis sheets are provided in **Appendix C.**

CUMULATIVE PLUS PROJECT

LANE GEOMETRY AND CONTROL

The project is not proposing any roadway improvements at any study intersection and therefore Cumulative Plus Project conditions assumed existing lane geometry as illustrated in **Figure 3**.

TRAFFIC VOLUMES

The Project is estimated to generate a net 497 daily trips, a total of 49 AM peak hour trips (89 inbound and -40 outbound), and 152 PM peak hour trips (55 inbound and 97 outbound). Cumulative Plus Project volumes were determined by adding the total project traffic, **Figure 6**, to the Cumulative conditions volume, **Figure 11**. Cumulative Plus Project peak hour volumes are shown in **Figure 12**.

INTERSECTION LEVEL OF SERVICE

Cumulative Plus Project traffic conditions were evaluated at the study intersections. Results are presented in **Table 6**. Intersections operate unacceptably but are not considered a project deficiency if the intersection is operating unacceptably without the project and the increase in v/c is less than 0.05. Intersection #8 – Airport Access Road and 98th Avenue operates unacceptably in the AM and PM peak hours, but is not considered a project deficiency because the project increases the v/c by less than 0.05. Intersection #5 – Doolittle Drive and Davis Street operates unacceptably in the AM and PM peak hours and is considered a project deficiency in the AM peak hour because the project increases the v/c by more than 0.05.

Analysis sheets are provided in **Appendix C**.

VEHICLE QUEUING

As congestion increases, it is common for traffic at intersections to form lines of stopped (or queued) vehicles. Queue lengths were determined for turn lanes in which significant project trips are being added, and the distance that vehicles will back up approaching an intersection were estimated. Synchro software calculates the 95th percentile queues based on Synchro software methodology. The 95th percentile queue is used to account for fluctuations in traffic and represents a condition where 95 percent of the time during the peak period, traffic volumes will be less than or equal to the queue determined by the analysis. It is used as a benchmark for determining deficiencies as a standard transportation engineering practice. A typical vehicle length of 25 feet was used in the queuing analysis. The effect of vehicle queuing was analyzed by reporting the 95th percentile queues for turning movements where the project would add trips to existing or proposed turn pockets. Left-turn lane vehicle queuing that exceeds a turn pocket length can create potentially hazardous conditions by blocking or disrupting through traffic in adjacent travel lanes. An operational deficiency, and not a significant impact, was assumed to occur if the left turn queue increases by one or more vehicles and the vehicle queue exceeds the left turn pocket length.

All queue lengths are contained within the available storage and the project does not increase the queue by one or more vehicles, except for the following movements:

- Intersection #5 – Doolittle Drive and Davis Street
    - Westbound right-turn (AM peak hour in Near Term plus Project and Cumulative plus Project scenarios)

The analysis showed that the westbound right-turn queue at Doolittle Drive and Davis Street exceeds the storage bay length of 120 feet. In the Near Term plus Project scenario and Cumulative plus Project scenario, the project trips increased the westbound right-turn queue by 146 feet and 141 feet in the AM peak hour, respectively. However, since the westbound right-turn vehicles will go during the same signal phase as the westbound through vehicles, this is not considered a queuing deficiency. Therefore, although the westbound right-turn queue extends beyond the storage length, it is not expected to cause any safety issues and no improvement is necessary.

The vehicle queuing summary is shown in **Table 7**.

6. ALAMEDA COUNTY TRANSPORTATION COMMISSION LAND USE ANALYSIS PROGRAM

This chapter presents the results of the Alameda CTC Land Use analysis under Year 2020 and Year 2040 Conditions, with and without the Project, in the PM peak hour.

YEAR 2020 AND YEAR 2040 NO PROJECT CONDITIONS

The Alameda CTC Land Use analysis was performed to comply with its congestion management plan (CMP) Land Use Analysis Program. In the CMP, development projects generating more than 100 PM net new peak hour trips are analyzed to determine its impact on Metropolitan Transportation System (MTS) roadways. Since the ACTC Land Use Analysis Program's 100-trip criteria is in the PM peak hour and the project generates greater project trips in the PM peak hour than the AM peak hour, the analysis was evaluated in the PM peak hour only.

The Alameda CTC travel demand model for Year 2020 and Year 2040 was used to determine 2020 and 2040 traffic volumes in the PM peak hour along the MTS roadways of Doolittle Drive and Davis Street. Traffic volumes and the number of lanes in each direction were used to determine the segment v/c ratio. It is assumed that the capacity of the roadway segment is 800 vehicles per hour per lane (vphpl).

Based on the analysis, the following MTS roadway segments operate at an unacceptable LOS F in Year 2020 and 2040 Conditions during the PM peak hour:

Year 2020 Conditions

- Northbound Doolittle Drive from Davis Street to Adams Avenue
- Eastbound Davis Street from Doolittle Drive to I-880 SB Ramps

Year 2040 Conditions

- Northbound Doolittle Drive from Davis Street to Adams Avenue
- Southbound Doolittle Drive from Adams Avenue to Davis Street
- Eastbound Davis Street from Doolittle Drive to I-880 SB Ramps
- Westbound Davis Street from I-880 SB Ramps to Doolittle Drive

YEAR 2020 AND YEAR 2040 PLUS PROJECT CONDITIONS

Project trips during the PM peak hour were added to the roadway segments under Year 2020 and Year 2040 Conditions to determine the v/c ratio under Plus Project Conditions. Based on the analysis, the following roadway segments continue to operate at an unacceptable LOS F in Plus Project Conditions:

Year 2020 Plus Project Conditions

- Northbound Doolittle Drive from Davis Street to West Project Driveway
  - With the addition of the project trips, this results in an increase in v/c of more than 0.02 – **Project Deficiency**
- Northbound Doolittle Drive from Adams Avenue to West Project Driveway
  - With the addition of the project trips, this results in an increase in v/c of less than 0.02 – **Not a Deficiency**
- Eastbound Davis Street from Doolittle Drive to I-880 SB Ramps
  - With the addition of the project trips, this results in an increase in v/c of less than 0.02 – **Not a Deficiency**

Year 2040 Plus Project Conditions

- Northbound Doolittle Drive from Davis Street to West Project Driveway
    - With the addition of the project trips, this results in an increase in v/c of more than 0.02 – **Project Deficiency**
- Northbound Doolittle Drive from Adams Avenue to West Project Driveway
    - With the addition of the project trips, this results in an increase in v/c of less than 0.02 – **Not a Deficiency**
- Southbound Doolittle Drive from Adams Avenue to West Project Driveway
    - With the addition of the project trips, this results in an increase in v/c of less than 0.02 – **Not a Deficiency**
- Southbound Doolittle Drive from West Project Driveway to Davis Street
    - With the addition of the project trips, this results in an increase in v/c of more than 0.02 – **Project Deficiency**
- Eastbound Davis Street from Doolittle Drive to I-880 SB Ramps
    - With the addition of the project trips, this results in an increase in v/c of less than 0.02 – **Not a Deficiency**
- Westbound Davis Street from I-880 SB Ramps to Doolittle Drive
    - With the addition of the project trips, this results in an increase in v/c of more than 0.02 – **Project Deficiency**

Table 8 and **Table 9** summarize the roadway segment capacity analysis for Year 2020 and Year 2040, respectively.

Table 8 – Year 2020 ACTC Roadway Segment Analysis

Note: Segments that are operating below acceptable levels are shown in **BOLD**. Project caused deficiencies are shaded.

7. SITE ACCESS AND CIRCULATION

This section discusses site access, site circulation, pedestrian facilities, bicycle facilities, transit recommendations, and sight distance analysis for the project.

The following summarizes the project access locations:

- Doolittle Drive and West Project Driveway
  - Stop-controlled westbound movement for project driveway
  - Full access
- Hester Street and North Project Driveway
  - Stop-controlled eastbound and westbound movement for project driveway
  - Full access

Appendix C contains the queuing worksheets for the Project's driveways. These AM/PM peak hour worksheets are the results of the Cumulative Plus Project Conditions and show that the west and north project driveway throat depths are sufficient to accommodate the project outbound queues during the peak hours. For the west project driveway, the throat depth was measured as approximately 50 feet, which is the distance from Doolittle Drive to the internal drive aisle at 900 Doolittle Drive. As shown, the estimated outbound vehicle queue is less than 25 feet, which does not exceed the throat depth of 50 feet. However, it is possible that a truck with a vehicle length of more than 50 feet may temporarily block the drive aisle at 900 Doolittle Drive. In this case, vehicles may queue within the drive aisle; however, this should not result in vehicles queuing onto Doolittle Drive and therefore does not require any improvements. For the north project driveway, the throat depths were measured as approximately 50 feet for both the eastbound and westbound approach, which is the distance from Hester Street to the first parking space. As shown, the estimated outbound vehicle queue is less than 25 feet, which does not exceed the throat depth of 50 feet. Therefore, there are no anticipated conflicts or excessive queuing.

VEHICLE SITE CIRCULATION

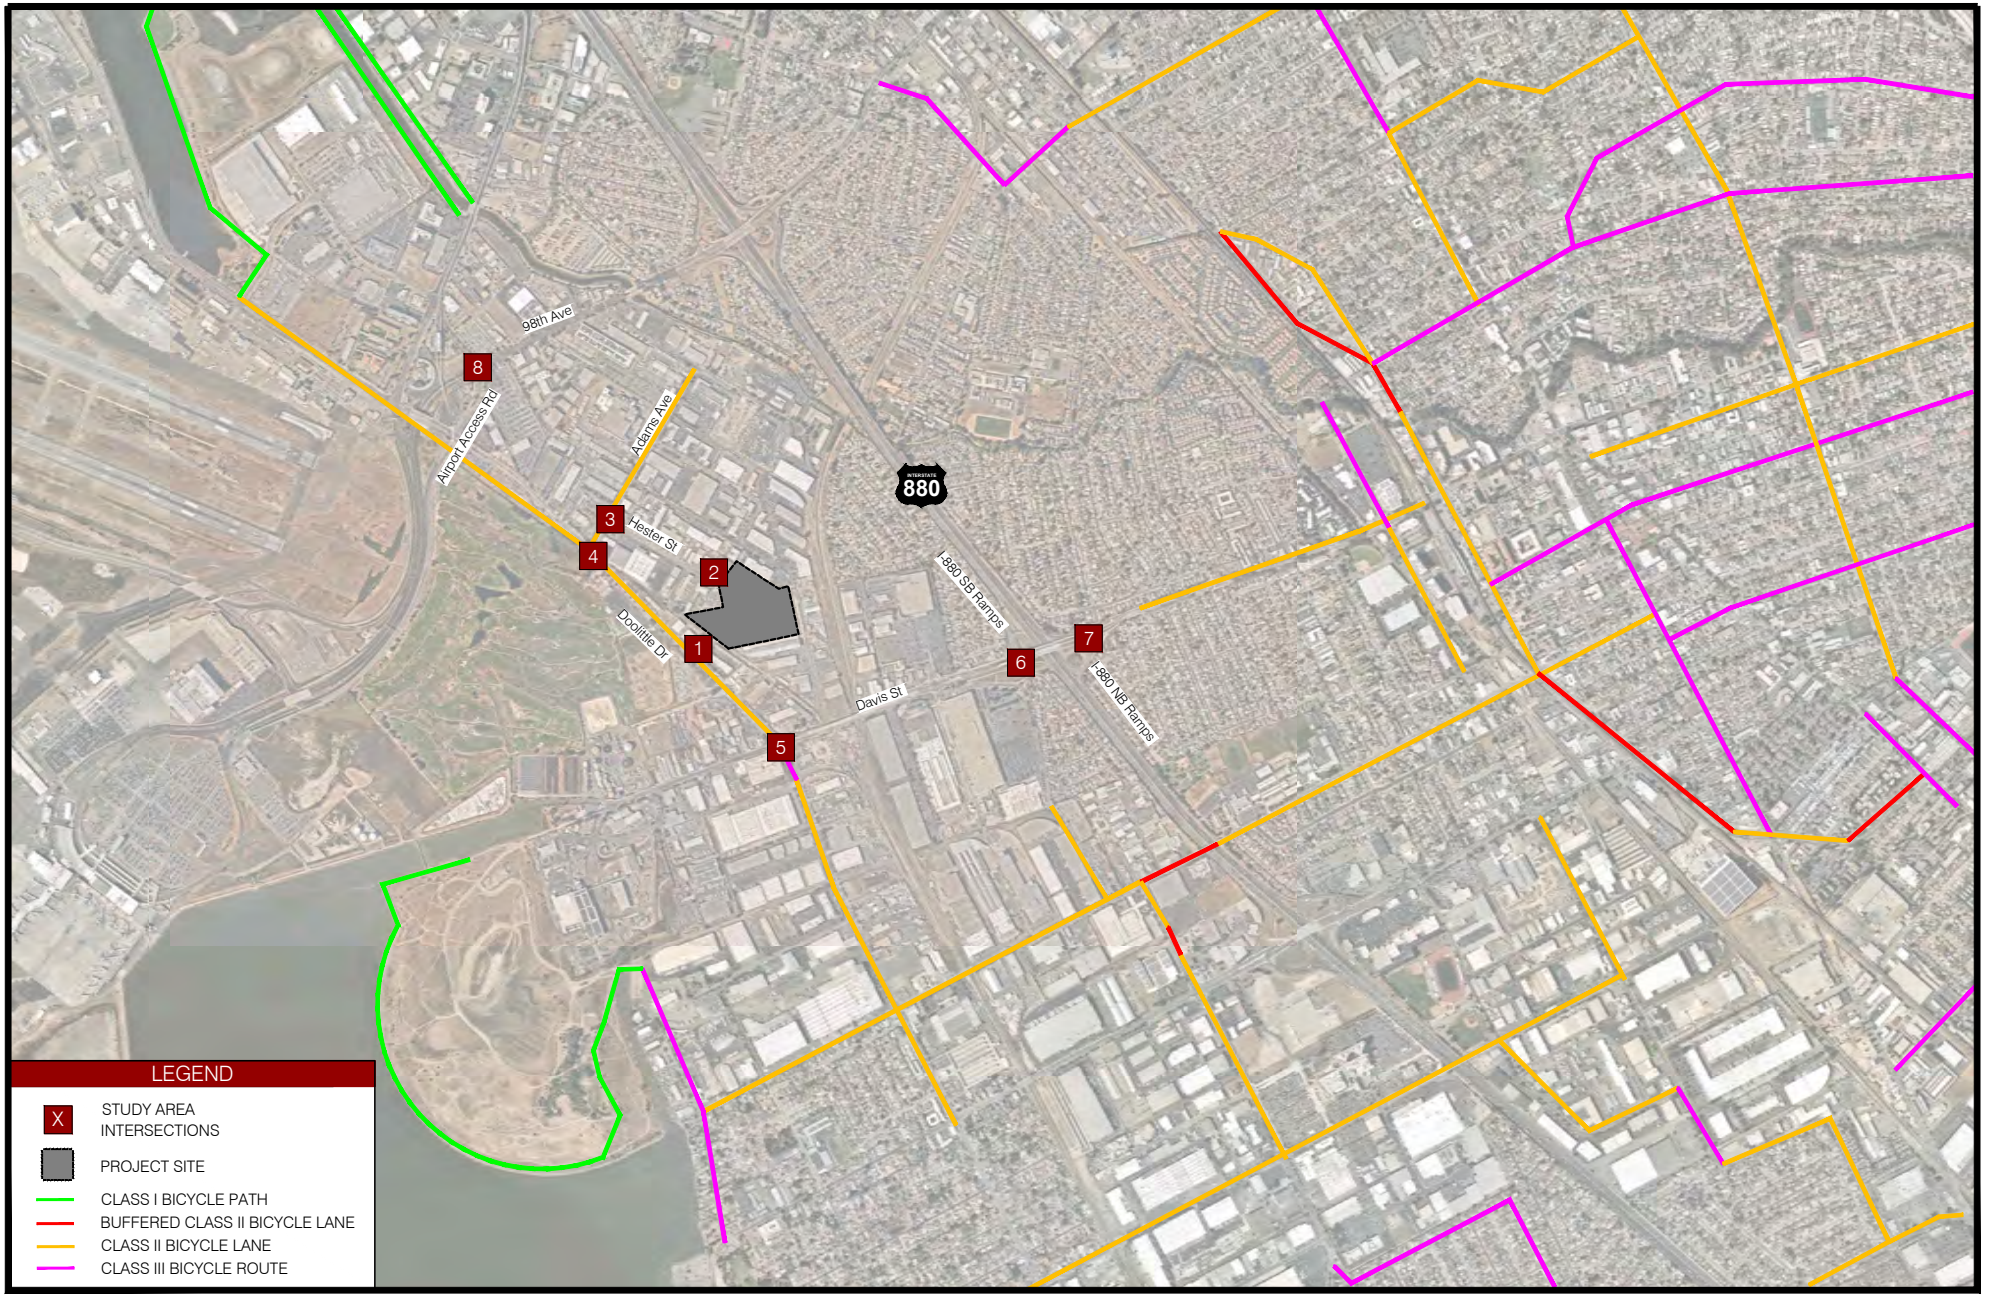
Passenger cars and trucks may use the West Project Driveway and North Project Driveway to enter the site. All truck parking is located on the north side of the site and the passenger car parking spaces are located to the west of the site. 24 dock doors are located on the north site of the building and 37 dock doors are located on the south side. Vehicles may use the drive aisles proposed on all sides of the building to access these parking spaces and docks.

PEDESTRIAN FACILITIES

There are existing continuous sidewalks on both sides of Doolittle Drive adjacent to the project site where pedestrians can access the site, as well as existing continuous sidewalks on both sides of Adams Avenue and on the east side of Hester Street. There are also existing crosswalks along the east, south, and west legs at the signalized intersection of Doolittle Drive and Davis Street, and existing crosswalks on the east and south legs at the signalized intersection of Doolittle Drive and Adams Street.

Within the project site, there are marked pedestrian crosswalks connecting the accessible parking spaces to the sidewalks along the west side of the building. These sidewalks along the west side of the building provide access to the office spaces. There are sufficient pedestrian facilities adjacent to the project and to nearby complimentary uses.

BICYCLE FACILITIES



Bicycles will have access to the project site using the Class II bicycle lanes along Doolittle Drive and Adams Avenue. Existing bicycle facilities are shown in **Figure 13**.

Within the project site, bicycle parking will be provided on the ground level. The project provides 12 short-term and 12 long-term bicycle parking spaces, which meets the City's requirements. Since there are sufficient bicycle facilities adjacent to the project, to nearby complimentary uses, and within the project site, no additional bicycle facilities are recommended to be constructed by the project.

TRANSIT

For those taking transit, Alameda-Contra Costa Transit District (AC Transit) bus routes 34, 35, 73, 98, 805 operate within the study area. The nearest bus stop is located at the intersection of Westgate Parkway and Davis Street, which is approximately 0.9 miles southeast of the project site. The San Leandro BART station, which serves the Blue, Green, and Orange BART lines, is located within 2.1 miles east of the project site. The San Leandro LINKS shuttle is a free shuttle to and from the San Leandro BART station that operates a North Loop and South Loop. The North Loop runs along Davis Street from the BART station to Marina Boulevard, Merced Street, Williams Street, Doolittle Drive, and Davis Street. There is an existing stop located at Doolittle Drive and Davis Street. Pedestrians can travel between the LINKS bus stop and the project site using the existing sidewalks located along both sides of Davis Street. Existing transit facilities are shown in **Figure 14**.

Since the LINKS route serves as a sufficient transit facility in proximity to the project along Davis Street to nearby complimentary uses, no additional transit facilities are recommended to be constructed by the project.

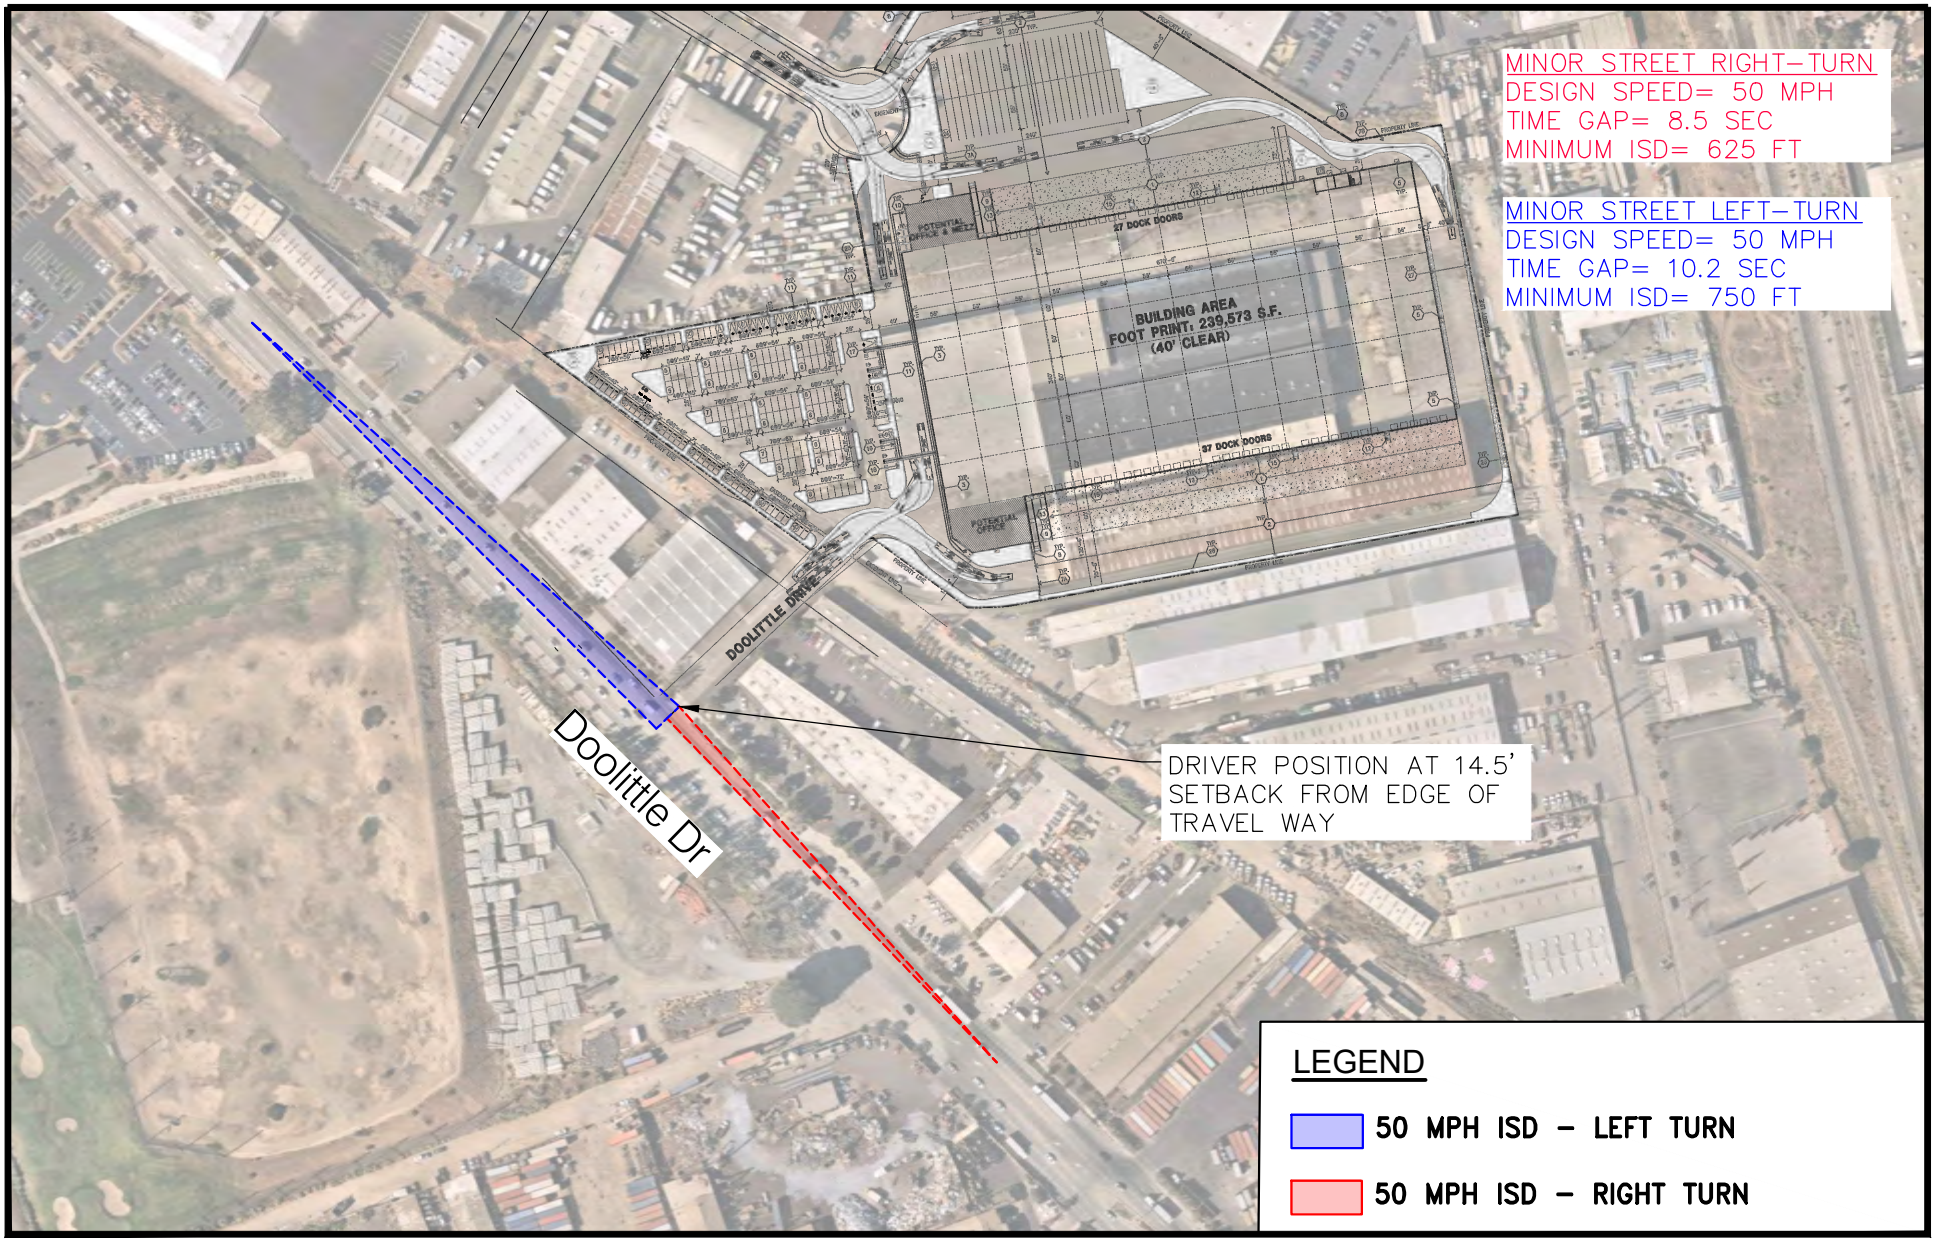
FIGURE 14
TRANSIT FACILITIES

SIGHT DISTANCE

A sight distance analysis for the project driveways was conducted to determine if vehicles exiting the driveway would have adequate sight distance to observe conflicting traffic along the major roadway adjacent to the project site. Intersection sight distance for the project driveway was evaluated following methodology from the American Association of State Highway and Transportation Officials (AASHTO), *A Policy on Geometric Design of Highway and Street, 7th Edition*[5]. Sight distance for each project driveway was determined based on the proposed project site plan and the following AASHTO intersection sight distance criteria formula:



$$\text{Intersection Sight Distance} = 1.47 \times V_{major} \times t_g$$

Where V_{major} is the design speed of the major road and t_g is the time gap for the vehicle to exit the project driveway and enter the major road. No spot speed study was conducted; design speeds were used to determine sight distance.

Intersection #1 – Doolittle Drive and West Project Driveway

Using the time gap for passenger cars, the time gap is 8.5 seconds for a truck to make a right-turn movement onto Doolittle Drive and 10.2 seconds to make a left-turn movement. With a 50-mph design speed along Doolittle Drive, the sight distance criteria for trucks making a right-turn is 625 feet and the sight distance criteria for trucks making a left-turn is 750 feet. As shown in the **Figure 15**, the sight triangles at the West Project Driveway should be clear of obstructions for a vehicle exiting the driveway to observe oncoming northbound and southbound vehicles along Doolittle Drive.

[5] *A Policy on Geometric Design of Highway and Street, 7th Edition,* American Association of State Highway and Transportation Officials (AASHTO), 2018.

INTERSECTION #1 INTERSECTION SIGHT DISTANCE

8. PARKING

This chapter summarizes the Project's parking requirements.

SAN LEANDRO PARKING REQUIREMENTS

Parking requirements for land uses within the City of San Leandro are provided in Chapter 4.08.108 of the San Leandro Municipal Code. This section includes parking requirements for vehicles and bicycles.

VEHICLE PARKING REQUIRED

Required parking for vehicles is based on land use. In accordance with the San Leandro Municipal Code, parking for office, warehousing, distributions, and storage facilities shall be provided at the following rates:

- Office: 1 space per 300 square feet
- Warehousing, Distributions and Storage Facilities: 1 space per 1,500 square feet

Assuming the project site has a 10,000-square foot office and a 229,573-square foot warehouse, the City requires 203 spaces. The project provides a total of 204 parking spaces and 59 trailer parking stalls, which provides adequate parking as required by the City.

The California Green Building Standard Code requires at least 10 percent of the total parking spaces to be Electric Vehicle (EV) Ready parking spaces. With the proposed 204 parking spaces, the project would be required to designate at least 21 EV Ready parking spaces. 21 EV spaces are proposed, which meets the requirement.

The 2010 Americans with Disabilities Act (ADA) Standards for Accessible Design requires at least seven accessible parking spaces for a parking facility with 201 to 300 parking spaces. With the proposed 204 parking spaces, the project would be required to designate at least seven accessible parking spaces. The project is proposing eight accessible parking spaces, which meets the requirement.

BICYCLE PARKING REQUIRED

Required parking for bicycles is based on type of land use. Bicycle parking for office, warehousing, distribution, and storage facilities is to be provided at the following rates:

- Short-term: 5% of the requirement for automobile parking spaces
- Long-term: 5% of the requirement for automobile parking spaces

With 204 parking spaces proposed, this results in 11 required long-term and 11 short-term bicycle parking spaces.

The site provides 12 long-term and 12 short-term bicycle parking spaces, which meets the City's requirement.

9. CONCLUSION

This section summarizes the results and recommendations of this TIA.

PROJECT RECOMMENDATIONS

OFF-SITE ROADWAY IMPROVEMENTS

The project does not propose any off-site roadway improvements associated with the project design.

PEDESTRIAN FACILITIES

Continuous sidewalks exist on both sides of Doolittle Drive, both sides of Adams Avenue, and on the east side of Hester Street. There are also existing signalized crossings in the north, east, and south directions at the intersection of Doolittle Drive and Davis Street, and existing signalized crossings in the north and east directions at the intersection of Doolittle Drive and Davis Street.

Within the project site, there are marked pedestrian crosswalks connecting the accessible parking spaces to the west side building sidewalk. There are sidewalks along the west side of the building which provide access to the office spaces.

BICYCLE FACILITIES

Bicycles will have access to the project site using the Class II bicycle lanes along Doolittle Drive and Adams Avenue. Therefore, no additional bicycle facilities are proposed. The project is proposing to include 12 short-term and 12 long-term bicycle parking spaces on-site, which satisfy the City's requirements.

TRANSIT FACILITIES

Alameda-Contra Costa Transit District (AC Transit) bus routes 34, 35, 73, 98, 805 operate within the study area, with the nearest bus stop located at the intersection of Westgate Parkway and Davis Street, which is approximately 0.9 miles southeast of the project site. The San Leandro LINKS shuttle is a free shuttle to and from the San Leandro BART station, which is 2.1 miles east of the project site, that operates a North Loop and South Loop. The North Loop has an existing stop located at Doolittle Drive and Davis Street. Pedestrians can travel between the LINKS bus stop and the project site using the existing sidewalks located along both sides of Davis Street. Since the LINKS route serves as a sufficient transit facility in proximity to the project along Davis Street to nearby complimentary uses, no additional transit facilities are recommended to be constructed by the project.

PARKING REQUIREMENTS

The project is proposing to provide 204 parking spaces and 59 trailer parking stalls. The City requires a minimum of 204 spaces. Therefore, the project does provide enough parking to satisfy the City's requirements.

The California Green Building Standard Code requires at least 10 percent of the total parking spaces to be Electric Vehicle (EV) Ready parking spaces. With the proposed 204 parking spaces, the project would be required to designate 21 EV Ready parking spaces. 21 EV spaces are proposed, which meets the requirement.

The 2010 Americans with Disabilities Act (ADA) Standards for Accessible Design requires at least seven accessible parking spaces for a parking facility with 201 to 300 parking spaces. With the proposed 204 parking spaces, the project would be required to designate at least seven accessible parking spaces. The project is proposing eight accessible parking spaces, which meets the requirement.

PROJECT DRIVEWAYS

The development of the proposed Project will access the following existing driveways:

- Doolittle Drive and West Project Driveway
  - Stop-controlled westbound movement for project driveway
  - Full access
- Hester Street and North Project Driveway
  - Stop-controlled eastbound and westbound movement for project driveway
  - Full access

PROJECT IMPACTS AND MITIGATIONS

As discussed previously in the Chapter 6, the project VMT/employee (i.e. 15.34 in 2020 and 16.08 in 2040) is not expected to exceed the threshold of significance for VMT/employee for Central Planning Area (i.e. 16.3 in 2020 and 16.2 in 2040) and the project will result in a less than significant transportation impact. No mitigation needed.

PROJECT DEFICIENCIES

LOS DEFICIENCIES

In cases when the project traffic worsens an intersection from an acceptable LOS to an unacceptable LOS or if the project traffic increases the intersection v/c by 0.05 for an intersection that is already operating unacceptably without the project, this is considered a project deficiency. Based on the results of the traffic analysis, the following intersection project deficiencies are noted:

- Intersection #5 – Doolittle Drive and Davis Street
  - Near Term Plus Project (AM peak hour)
  - Cumulative Plus Project (AM peak hour)

Project LOS Deficiency: Doolittle Drive and Davis Street (Intersection #5)

The intersection of Doolittle Drive and Davis Street will have an LOS deficiency in the Near Term Plus Project and Cumulative Plus Project for the AM peak hour.

Near Term Plus Project

In the Near Term Plus Project conditions, the intersection of Doolittle Drive and Davis Street will operate at an unacceptable LOS F with a delay of 127.4 seconds and a v/c ratio of 1.04 in the AM peak hour. The intersection operates at an unacceptable LOS F without the project with a delay of 110.7 seconds and a v/c ratio of 0.97 in the AM peak hour. Since the intersection operates at an unacceptable LOS for without project conditions and the addition of project trips causes the v/c ratio to increase by more than 0.04, this is a project deficiency.

Deficiency Improvement. Optimizing signal timings for this intersection would improve the delay to 89.7 seconds and the v/c ratio to 1.01 in the AM peak hour in the Near Term Plus Project condition. Since the v/c ratio would increase by less than 0.05, this would no longer be a deficiency with the proposed improvement. Traffic signal control analysis sheets can be found in **Appendix C**.

Cumulative Plus Project

In the Cumulative Plus Project conditions, the intersection of Doolittle Drive and Davis Street will operate at an unacceptable LOS F with a delay of 173.2 seconds and a v/c ratio of 1.27 in the AM peak hour. The intersection operates at an unacceptable LOS F without the project with a delay of 156.8 seconds and a v/c ratio of 1.20 in the AM peak hour. Since the intersection operates at an unacceptable LOS for without project conditions and the addition of project trips causes the v/c ratio to increase by more than 0.04, this is a project deficiency.

Deficiency Improvement. Optimizing signal timings for this intersection would improve the delay to 129.6 seconds and the v/c ratio to 1.22 in the AM peak hour in the Cumulative Plus Project condition. Since the v/c ratio would increase by less than 0.05, this would no longer be a deficiency with the proposed improvement. Traffic signal control analysis sheets can be found in **Appendix C**.

QUEUING DEFICIENCIES

In cases when the addition of project trips causes a queue to exceed the turn pocket length or increase by one or more vehicles for vehicle queues that already exceed the turn pocket length, an intersection project queuing deficiency was identified. Based on the results of the traffic analysis, no intersection project queuing deficiencies are noted.

ROADWAY SEGMENT DEFICIENCIES

In cases when the addition of project trips causes an acceptably operating roadway segment to operate at an unacceptable LOS F or increases the v/c of an unacceptably operating roadway segment by more than 0.02, a roadway segment project deficiency was identified. Based on the results of the traffic analysis, the following roadway segment project deficiencies are noted:

- Year 2020 Plus Project
    - Northbound Doolittle Drive from Davis Street to West Project Driveway
- Year 2040 Plus Project
    - Northbound Doolittle Drive from Davis Street to West Project Driveway
    - Southbound Doolittle Drive from West Project Driveway to Davis Street
    - Westbound Davis Street from I-880 SB Ramps to Doolittle Drive

Based on the Alameda CTC methodology, each roadway segment would need to be widened to add additional through lanes on Doolittle Drive and Davis Street. Since each roadway segment has adjacent land uses and is built out, it is infeasible to add additional travel lanes on Doolittle Drive and Davis Street. In addition, Davis Street between the I-880 SB Ramps and Doolittle Drive includes a bridge section that would make widening infeasible.

1 INTRODUCTION

This report presents the results of the traffic analysis (TA) for the proposed 880 Doolittle development (Project), which is located at 880 Doolittle Drive within the City of San Leandro as shown on Exhibit 1-1.

The purpose of this TA is to evaluate the potential deficiencies related to traffic and circulation system operations that may result from the development of the proposed Project, and to recommend improvements to mitigate potential deficiencies in order to achieve acceptable circulation system operations. This report has been prepared through consultation with City of San Leandro staff and their consultants.

1.1 SUMMARY OF FINDINGS

The following improvement has been identified as a cumulative traffic deficiency under Horizon Year (2040) traffic conditions:

- The intersection of Doolittle Drive and Project Driveway was found to operate at an acceptable LOS for Existing, E+P, and Horizon Year (2040) Without Project traffic conditions, however the intersection was found to operate at an unacceptable LOS during the peak hours under Horizon Year (2040) With Project traffic conditions. As such, a traffic signal has been recommended at this location and the Project should contribute fair share payment towards this improvement.

Additional details and intersection lane geometrics are provided in Section 1.7 *Site Access Improvements* of this report. The proposed Project will contribute to both existing and future year deficiencies, however, the net change in the proposed Project traffic is not anticipated to have a measurable effect with the exception of the intersection of the intersection of Doolittle Drive and Project Driveway.

1.2 PROJECT OVERVIEW

The Project is proposed to consist of a 106,190 square foot distribution warehouse use (square footage includes mezzanine space). Vehicular and truck traffic access will be provided via Hester Street and Doolittle Drive (see Exhibit 1-2). Specifically, all truck access to the site will occur off Hester Street, employee access is provided via both Hester Street and Doolittle Drive (via Project Driveway), and all van access is to occur off of Doolittle Drive (via Project Driveway). Regional access to the Project site is provided via the I-880 Freeway via 98th Avenue and Davis Street interchanges.

EXHIBIT 1-1: LOCATION MAP

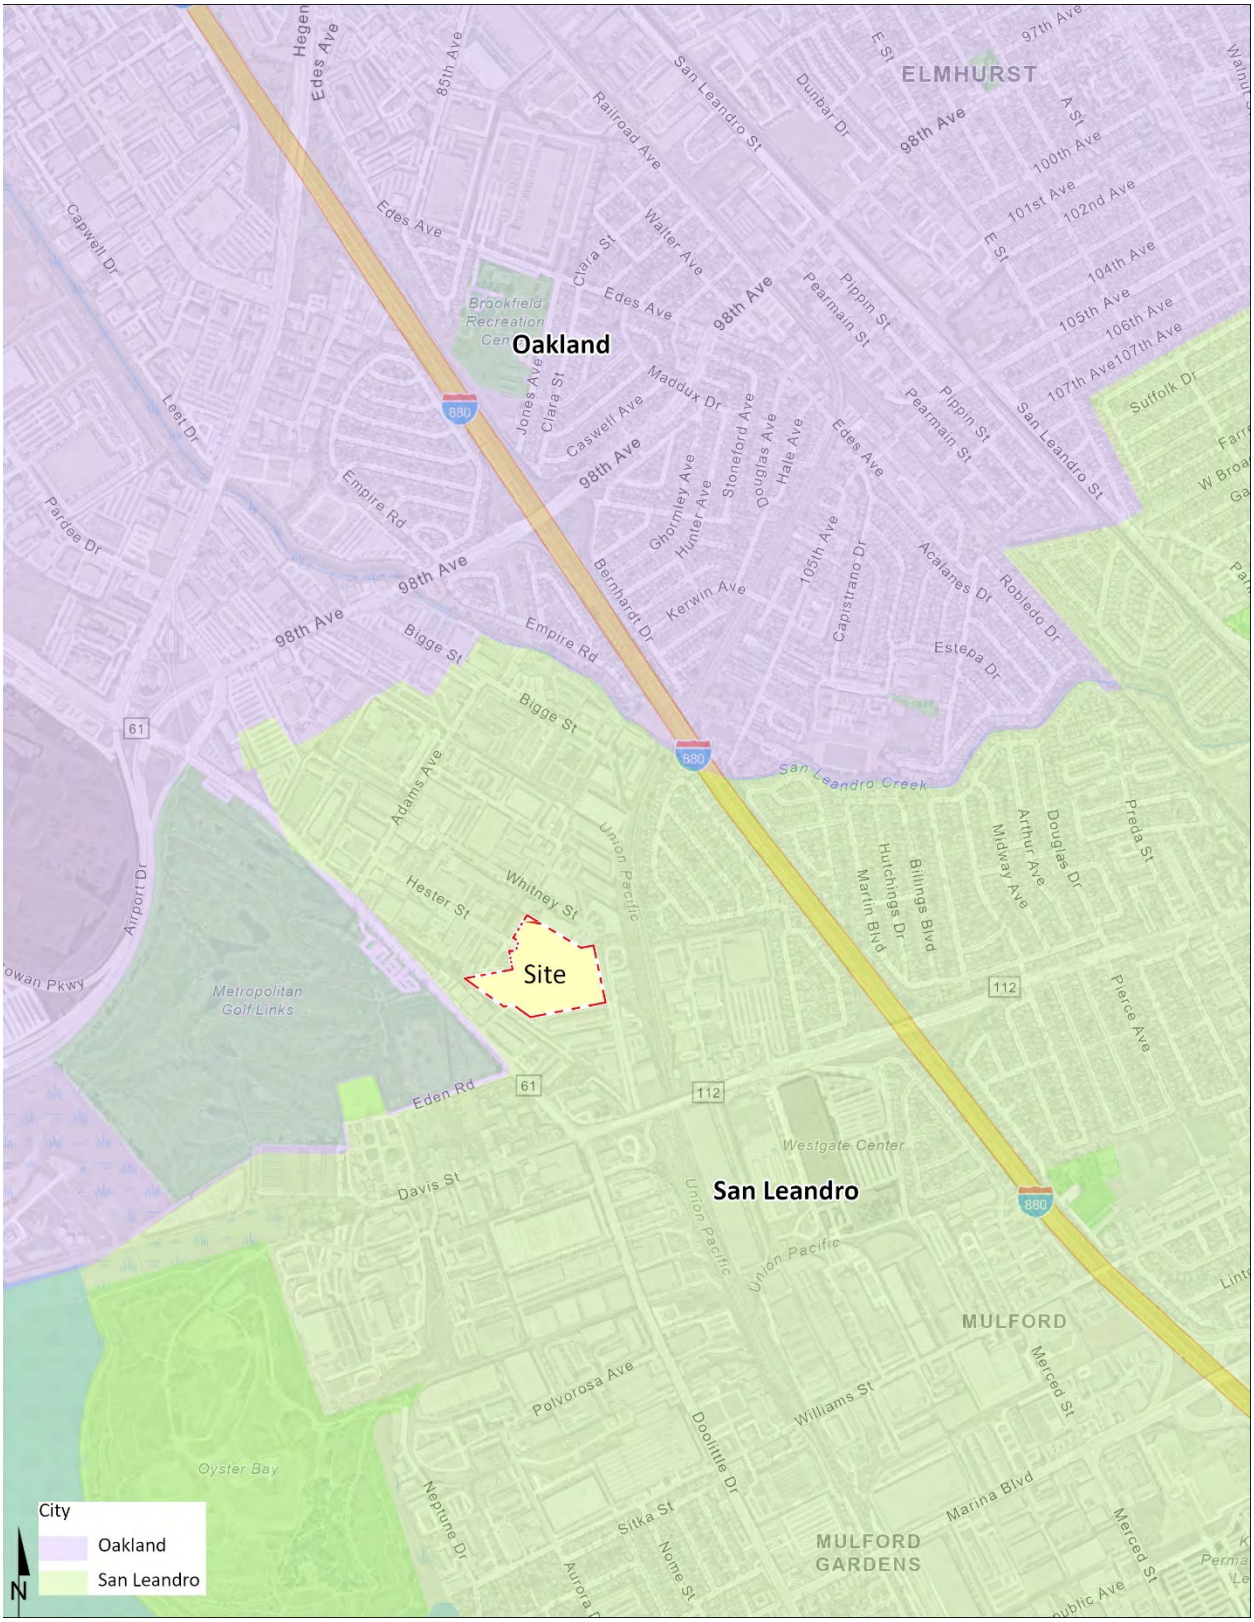

EXHIBIT 1-2: PRELIMINARY SITE PLAN

The trip generation estimates for the proposed Project have been developed using data provided by the future tenant. The Project is estimated to generate 1,136 two-way trips per day on a typical weekday with approximately 196 AM peak hour trips and 83 PM peak hour trips. The site is currently occupied by an existing use, as such, the Project is anticipated to generate 409 fewer two-way trips per day, with 32 net new AM peak hour trips and 58 fewer net PM peak hour trips. The assumptions and methods used to estimate the Project's trip generation characteristics are discussed in greater detail in Section 4.1 *Project Trip Generation* of this report.

1.3 ANALYSIS SCENARIOS

For the purposes of this traffic study, potential deficiencies to traffic and circulation have been assessed for each of the following conditions:

- Existing (2020)
- Existing Plus Project (E+P)
- Horizon Year (2040) Without and With Project

1.3.1 EXISTING (2020) CONDITIONS

Information for Existing (2020) conditions is disclosed to represent the baseline traffic conditions as they existed at the time this report was prepared. Due to the currently ongoing COVID-19 pandemic, 2015 traffic counts were adjusted by 0.772% per year (compounded annually) over 5 years to reflect 2020 baseline traffic conditions. This annual growth rate is based on the average Association of Bay Area Governments (ABAG) projected growth for employment, population, and households for San Leandro. The 2015 counts (adjusted to 2020) were then compared to the recently collected 2020 counts in order to determine the net changes and to develop an adjustment factor. The average of all applicable locations was calculated to be 127% for AM and 106% for the PM. As such, the locations where historic count data were not available, the 2020 counts that were recently collected were increased by 127% in the AM peak hour and 106% in the PM peak hour. For the locations where both historic and actual 2020 data is available, the final adjusted 2020 traffic volumes were developed by taking the higher of the 2 volumes (between either the adjusted 2015 or the actual 2020).

1.3.2 EXISTING PLUS PROJECT CONDITIONS

The Existing Plus Project (E+P) analysis determines any traffic operation and circulation system deficiencies that would occur on the existing roadway system in the scenario of the Project being placed upon Existing conditions. The net new traffic proposed to be generated by the Project has been utilized for the purposes of this TA (delta of the proposed Project and existing use).

1.3.3 HORIZON YEAR (2040) CONDITIONS

The City's traffic consultant has provided future long-range Horizon Year (2040) Without Project traffic forecasts based on the Alameda Countywide Travel Demand Model. Net new Project traffic has been added to develop the Horizon Year (2040) With Project traffic forecasts. A

comparison of Horizon Year (2040) Without and With Project traffic conditions will be used to identify long-range peak hour cumulative intersection operational deficiencies.

1.4 STUDY AREA

To ensure that this TA satisfies the City of San Leandro traffic study requirements, Urban Crossroads, Inc. has coordinated with City staff to determine the proposed study area for this TA. The 14 study area intersections shown on Exhibit 1-3 and listed in Table 1-1 were selected for this TA. It should be noted, the Project contributes fewer than 50 net new peak hour trips at all study area intersections.

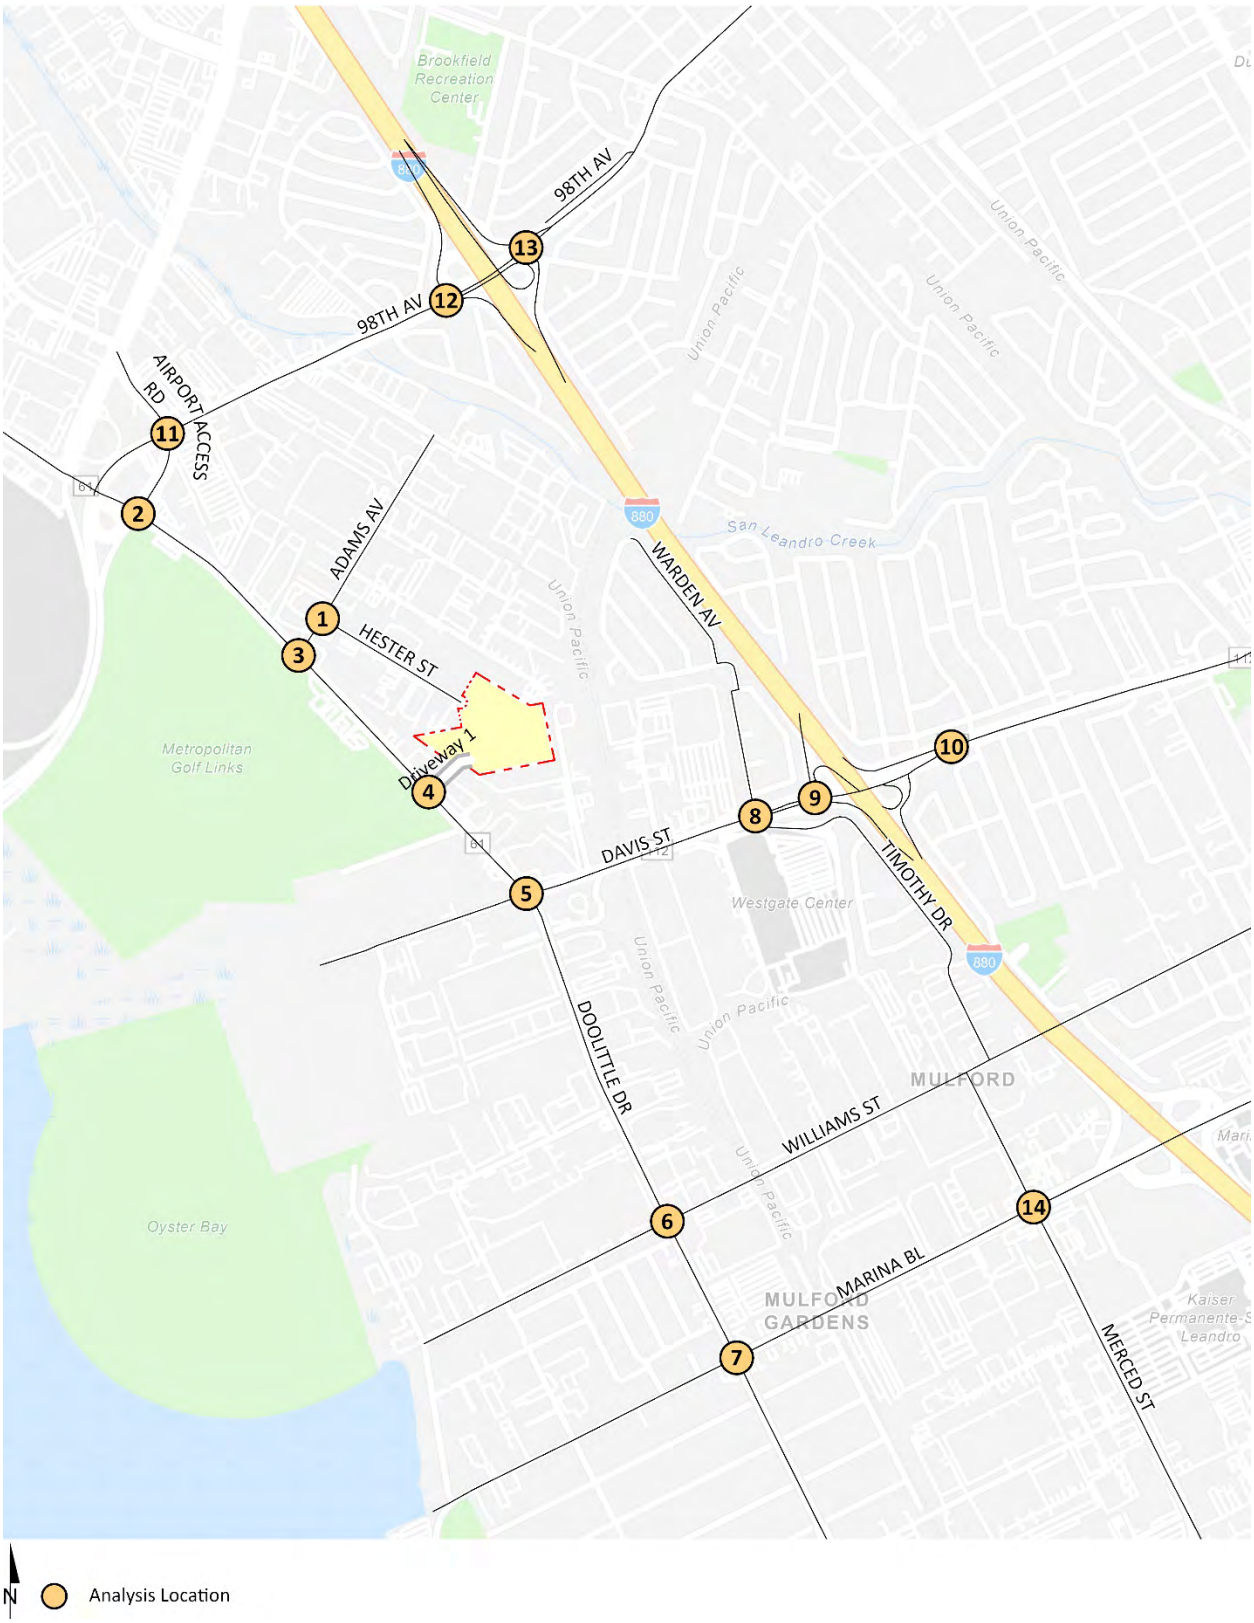

TABLE 1-1: INTERSECTION ANALYSIS LOCATIONS

ID	Intersection	Jurisdiction	CMP?
1	Hester St. & Adams Av.	City of San Leandro	No
2	Doolittle Dr. & Airport Access Rd.	City of Oakland	Yes
3	Doolittle Dr. & Adams Av.	City of San Leandro, City of Oakland	No
4	Doolittle Dr. & Project Dwy.	City of San Leandro, City of Oakland	No
5	Doolittle Dr. & Davis St.	City of San Leandro	Yes
6	Doolittle Dr. & Williams St.	City of San Leandro	No
7	Doolittle Dr. & Marina Bl.	City of San Leandro	Yes
8	Warden Av. & Davis St.	City of San Leandro	No
9	I-880 SB Ramps & Davis St.	City of San Leandro	Yes
10	I-880 NB Ramps & Davis St.	City of San Leandro	Yes
11	Airport Access Rd. & 98th Av.	City of Oakland	Yes
12	I-880 SB Ramps & 98th Av.	City of Oakland	Yes
13	I-880 NB Ramps & 98th Av.	City of Oakland	Yes
14	Merced St. & Marina Bl.	City of San Leandro	Yes

Note: A CMP intersection has been identified for any two CMP roadways that intersect one another.

The intent of a Congestion Management Program (CMP) is to more directly link land use, transportation, and air quality, thereby prompting reasonable growth management programs that will effectively utilize new transportation funds, alleviate traffic congestion and related deficiencies, and improve air quality. Counties within California have developed CMPs with varying methods and strategies to meet the intent of the CMP legislation. (1)

EXHIBIT 1-3: STUDY AREA

1.5 DEFICIENCIES

This section provides a summary of deficiencies by analysis scenario. Section 2 *Methodologies* provides information on the methodologies used in the analysis and Section 6 *Horizon Year (2040) Traffic Conditions* includes the detailed analysis. A summary of level of service (LOS) results for all analysis scenarios is presented on Table 1-2, which indicates that the following intersections will experience deficiencies under Existing and E+P traffic conditions:

- Doolittle Dr. & David St. (#5) – LOS E AM peak hour only
- Merced St. & Marina Bl. (#14) – LOS E PM peak hour only

As shown in Table 1-2, the following additional intersections are anticipated to operate at an unacceptable LOS during one or more peak hours under Horizon Year (2040) Without and With Project traffic conditions:

- Doolittle Dr. & Project Driveway (#4) – LOS E AM peak hour only (With Project only)
- Doolittle Dr. & Marina Bl. (#7) – LOS E PM peak hour only
- Airport Access Rd. & 98th Av. (#11) – LOS F PM peak hour only
- Merced St. & Marina Bl. (#14) – LOS E AM and PM peak hours

TABLE 1-2: SUMMARY OF LOS BY ANALYSIS SCENARIO

1.6 RECOMMENDATIONS

This section provides a summary of deficiencies by analysis scenario. Section 2 *Methodologies* provides information on the methodologies used in the analysis and Section 5 *E+P Traffic Conditions* and Section 6 *Horizon Year (2040) Traffic Conditions* includes the detailed analysis.

1.6.1 E+P CONDITIONS

The following study area intersections are anticipated to operate at an unacceptable LOS under E+P traffic conditions:

- Doolittle Dr. & Davis St. (#5) – LOS E AM peak hour only (consistent with Existing conditions)
- Merced St. & Marina Bl. (#14) – LOS E PM peak hour only (consistent with Existing conditions)

The addition of Project traffic at these two locations is anticipated to result in a change to the volume-to-capacity (v/c) ratio of less than 0.05. As such, no improvements have been recommended at these locations for E+P traffic conditions.

The following turning movements are anticipated to experience queuing issues for E+P traffic conditions and are consistent with existing deficient turning movements, however, the addition of Project traffic to these existing deficiencies result in nominal changes:

- Doolittle Dr. & Davis St. (#5) – Southbound left PM peak hour only
- Doolittle Dr. & Davis St. (#5) – Westbound right turn lane AM and PM peak hours
- Doolittle Dr. & Williams St. (#6) – Southbound left PM peak hour only
- Doolittle Dr. & Marina Bl. (#7) – Southbound left AM and PM peak hours
- Doolittle Dr. & Marina Bl. (#7) – Westbound left AM and PM peak hours
- Warden Av. & Davis St. (#8) – Southbound left AM peak hour only
- Airport Access Rd. & 98th Av. (#11) – Westbound left PM peak hour only

1.6.2 HORIZON YEAR (2040) CONDITIONS

The following study area intersections are anticipated to operate at a deficient LOS during one or both peak hours under Horizon Year (2040) Without Project traffic conditions:

- Doolittle Dr. & Davis St. (#5) – LOS F AM and PM peak hours
- Doolittle Dr. & Marina Bl. (#7) – LOS E PM peak hour only
- Airport Access Rd. & 98th Av. (#11) – LOS F PM peak hour only
- Merced St. & Marina Bl. (#14) – LOS E AM and PM peak hours

The addition of Project traffic is anticipated to have a significant effect on the intersection of Doolittle Drive and the Project Driveway only. The addition of Project traffic at the other two locations is anticipated to result in a change to the v/c ratio of less than 0.05. As such, no improvements have been recommended at those locations for Horizon Year (2040) With Project traffic conditions. Additional details and intersection lane geometrics are provided in Section 1.7 *Recommendations* of this report.

The following additional turning movements are anticipated to experience queuing issues for Horizon Year (2040) Without Project traffic conditions in addition to the existing deficient turning movements, however, the addition of Project traffic to these pre-project deficiencies result in nominal changes:

- Airport Access Rd. & 98th Av. (#11) – Southbound left PM peak hour only
- Merced St. & Marina Bl. (#14) – Westbound left AM peak hour only

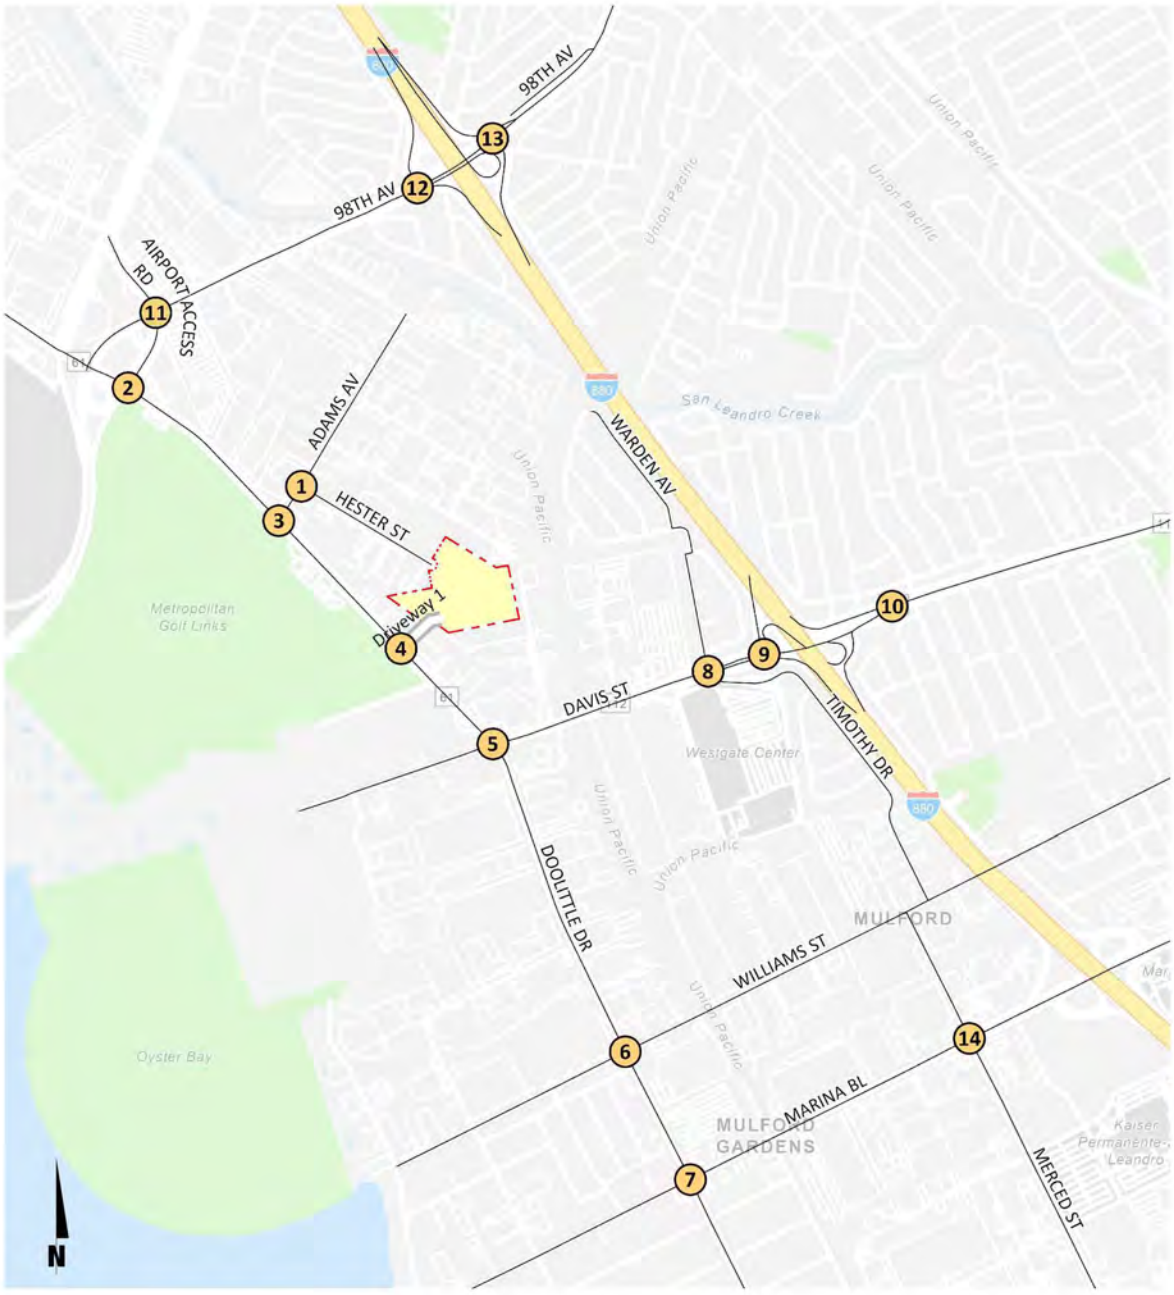
1.7 SITE ACCESS IMPROVEMENTS

The recommended site access driveway improvements for the Project are described below. Exhibit 1-4 illustrates the site access improvements. Construction of on-site and site adjacent improvements shall occur in conjunction with adjacent Project development activity or as needed for Project access purposes.

Hester St. & Adams Av. (#1) – Maintain existing traffic control and lane geometrics at this intersection.

Hester St. & Project Driveway – This is a new Project driveway/access at the southern terminus of Hester Street. The southbound approach on Hester Street approaching the Project is an existing lane. There is also a new driveway proposed to the southeast corner of the cul-de-sac that will lead into the truck court. There is also a new driveway proposed to the southwest corner of the cul-de-sac that will lead to the passenger car parking lot. Both the Project access points at the southern terminus should be signed with stop controls for the exiting Project traffic.

Doolittle Dr. & Project Driveway (#4) – It is recommended the Project will install a traffic signal at Driveway 1 on Doolittle Drive but would defer the installation of the traffic signal to a future date when the intersection meets the appropriate California Manual on Uniform Traffic Control Devices (CA MUTCD) warrants. The intersection should be monitored, and a traffic signal installed when the appropriate warrants are met. No other lane improvements are recommended.



Site access improvements for the driveways at the southern terminus of Hester Street are also shown on Exhibit 1-4.

Wherever necessary, roadways adjacent to the Project, site access points and site-adjacent intersections will be constructed to be consistent with the identified roadway classifications and respective cross-sections in the City of San Leandro General Plan Circulation Element.

On-site traffic signing and striping should be implemented agreeable with the provisions of the California Manual on Uniform Traffic Control Devices (CA MUTCD) and in conjunction with detailed construction plans for the Project site.

Sight distance at each project access point should be reviewed with respect to standard City of San Leandro sight distance standards at the time of preparation of final grading, landscape, and street improvement plans.

EXHIBIT 1-4: SITE ACCESS RECOMMENDATIONS

= New Traffic Signal
= Stop Sign
= Stop Sign Improvement
= Existing Lane
= Lane Improvement

Note: The Project will install a traffic signal at Driveway 1 on Doolittle Drive but would defer the installation of the traffic signal to a future date when the intersection meets the appropriate CA MUTCD warrants. The intersection should be monitored and a traffic signal installed when the appropriate warrants are met.

1.8 QUEUING ANALYSIS AT THE PROJECT DRIVEWAYS

A queuing analysis was conducted for the Project Driveway on Doolittle Drive in addition to the intersection of Hester Street at Adams Avenue for Horizon Year (2040) With Project traffic conditions to determine the 95th percentile queues. The analysis was conducted for the weekday AM and weekday PM peak hours. The traffic modeling and signal timing optimization software package Synchro/SimTraffic (Version 10) has been utilized to assess queues at the aforementioned intersections.

Synchro is a macroscopic traffic software program that is based on the signalized and unsignalized intersection capacity analyses as specified in the Highway Capacity Manual (HCM). SimTraffic is designed to model networks of signalized and unsignalized intersections, with the primary purpose of checking and fine-tuning signal operations. SimTraffic uses the input parameters from Synchro to generate random simulations. The 95th percentile queue is not necessarily ever observed; it is simply based on statistical calculations (or Average Queue plus 1.65 standard deviations). Many jurisdictions utilize the 95th percentile queues for design purposes. SimTraffic simulations have been recorded 5 times, during the weekday AM and weekday PM peak hours, and have been seeded for 15-minute periods with 60-minute recording intervals. Queuing results are provided in Appendix 1.1. Analysis results are summarized in Table 1-3.

TABLE 1-3: SITE ACCESS PEAK HOUR QUEUING SUMMARY

#	Intersection	Movement	Available Stacking Distance (Feet)	2040 With Project 95th % Queue (ft)		Acceptable? [1]	
				AM	PM	AM	PM
1	Hester St. & Adams Av.	NBL/R	100	68	60	Yes	Yes
		EBT/R	135	4	0	Yes	Yes
		WBL/T	150	34	21	Yes	Yes
4	Doolittle Dr. & Project Driveway	NBT/R	300	168	169	Yes	Yes
		SBL	100	47	32	Yes	Yes
		SBT/R	300	186	160	Yes	Yes
		WBL/R	265	150	86	Yes	Yes

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet (1 car length) of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

As shown in Table 1-3, there are no queuing issues anticipated at the site access locations for Horizon Year (2040) With Project traffic conditions. Note there is an existing at-grade rail spur located approximately 265-feet east of Doolittle Drive along the Project Driveway. However, the 95th peak hour queues demonstrate that queues are not anticipated to extend back to the existing rail spur.

1.9 TRUCK ACCESS

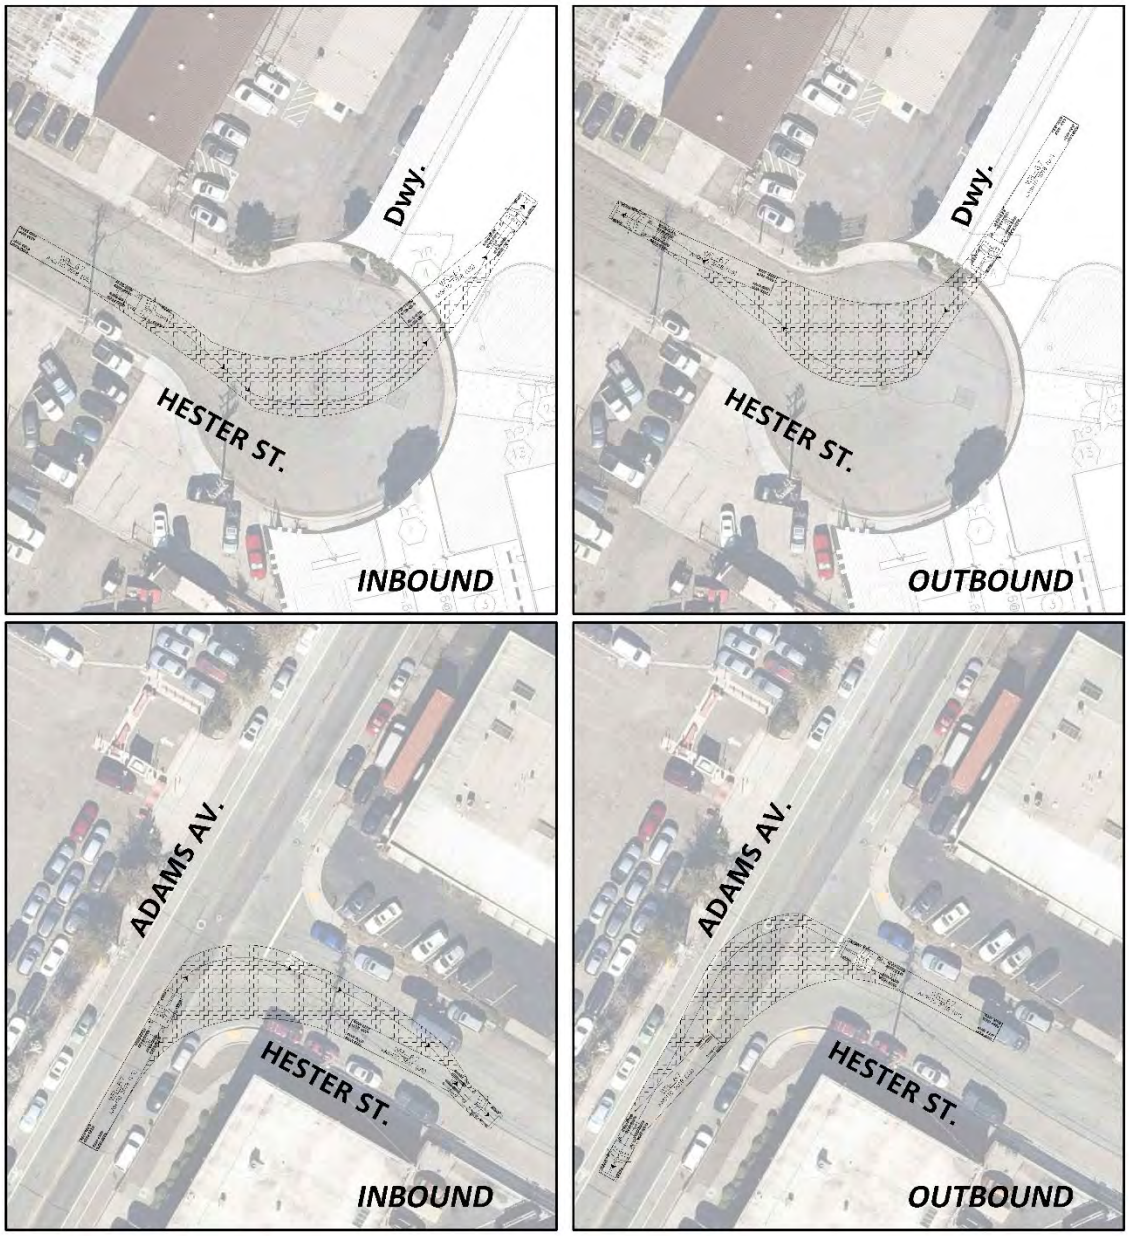
Due to the typical wide turning radius of large trucks, a truck turning template has been overlaid on the site plan at the applicable driveway at the southern terminus of Hester Street in conjunction with the intersection of Hester Street at Adams Avenue in order to determine appropriate curb radii and to verify that trucks will have sufficient space to execute turning maneuvers. As shown on Exhibit 1-5, the existing and proposed curb radii are anticipated to accommodate the wide turning radius of heavy trucks (WB-67, which has a 53-foot trailer). As such, no modifications have been recommended.

1.10 VEHICLE PARKING

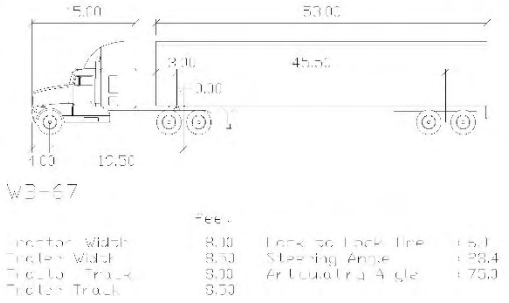
Based on the City's Municipal Code (Section 4.08.108) the Project's minimum parking is as follows:

- Office = 1 space / 300 square feet (sf) = 12,605 sf / 300 = 42 spaces
- Warehouse = 1 space / 1,000 sf = 93,585 sf / 1,500 = 94 spaces
- **Total of 136 spaces**

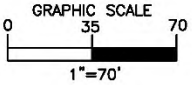
However, the Project is anticipated to provide the following parking spaces:



- Standard Stalls = 197 spaces
- Americans with Disabilities Act (ADA) Standard Stalls = 8 spaces
- ADA Van Stalls = 2 spaces
- Van Stalls = 434 spaces
- Van Staging = 40 spaces
- Van Loading = 36 spaces
- Trailer Stalls = 18 spaces
- **Total of 735 spaces**



Although the City's Municipal Code does not account for the proposed van parking spaces, it has been verified that the proposed number of van stalls can accommodate the anticipated number of vans (434 stalls plus 2 ADA stalls). The Project is anticipated to generate 250 van trips per day which equates to 125 vans. The proposed number of van stalls (436) can adequately park the proposed 125 vans per day and the 125 van drivers that would park their personal vehicles near their vans. As such, the proposed Project exceeds the City's standard parking requirements based on both the standard stall spaces and total parking spaces.



1.11 BICYCLE PARKING

Based on the City's Municipal Code (Section 4.08.128), the minimum bicycle parking is determined based on 5 percent of the vehicle parking, or 10 bicycle parking spaces (based on 207 standard vehicle parking spaces). The Project intends to accommodate 1 bike rack for every 2 spaces, or 104 bicycle racks based on a total of 207 standard vehicle parking spaces.

EXHIBIT 1-5: TRUCK TEMPLATES

This Page Intentionally Left Blank

2 METHODOLOGIES

This section of the report presents the methodologies used to perform the traffic analyses summarized in this report. The methodologies described are generally consistent with City of San Leandro traffic study guidelines.

2.1 LEVEL OF SERVICE

Traffic operations of roadway facilities are described using the term "Level of Service" (LOS). LOS is a qualitative description of traffic flow based on several factors such as speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

2.2 INTERSECTION CAPACITY ANALYSIS

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control. The LOS is typically dependent on the quality of traffic flow at the intersections along a roadway. The Highway Capacity Manual (HCM) methodology expresses the LOS at an intersection in terms of delay time for the various intersection approaches. (2) The HCM uses different procedures depending on the type of intersection control.

2.2.1 SIGNALIZED INTERSECTIONS

The City of San Leandro and City of Oakland require signalized intersection operations analysis based on the methodology described in the HCM. (2) Intersection LOS operations are based on an intersection's average control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections, LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 2-1. Study area intersections have been evaluated using the Synchro (Version 10) analysis software package.

Synchro is a macroscopic traffic software program that is based on the signalized intersection capacity analysis as specified in the HCM. Macroscopic level models represent traffic in terms of aggregate measures for each movement at the study intersections. Equations are used to determine measures of effectiveness such as delay and queue length. The level of service and capacity analysis performed by Synchro takes into consideration optimization and coordination of signalized intersections within a network.

TABLE 2-1: SIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Operations with very low delay occurring with favorable progression and/or short cycle length.	0 to 10.00	A	F
Operations with low delay occurring with good progression and/or short cycle lengths.	10.01 to 20.00	B	F
Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.01 to 35.00	C	F
Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.01 to 55.00	D	F
Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.01 to 80.00	E	F
Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths	80.01 and up	F	F

Source: HCM 2000

The peak hour traffic volumes have been adjusted using a peak hour factor (PHF) to reflect peak 15-minute volumes. Common practice for LOS analysis is to use a peak 15-minute rate of flow. However, flow rates are typically expressed in vehicles per hour. The PHF is the relationship between the peak 15-minute flow rate and the full hourly volume (e.g., PHF = [Hourly Volume] / [4 x Peak 15-minute Flow Rate]). The use of a 15-minute PHF produces a more detailed analysis as compared to analyzing vehicles per hour. Existing PHFs have been used for Existing (2020) baseline, E+P, and Horizon Year (2040) traffic conditions.

2.2.2 UNSIGNALIZED INTERSECTIONS

The City of San Leandro and City of Oakland require the operations of unsignalized intersections be evaluated using the methodology described the HCM. (2) The LOS rating is based on the weighted average control delay expressed in seconds per vehicle (see Table 2-2).

TABLE 2-2: UNSIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay Per Vehicle (Seconds)	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Little or no delays.	0 to 10.00	A	F
Short traffic delays.	10.01 to 15.00	B	F
Average traffic delays.	15.01 to 25.00	C	F
Long traffic delays.	25.01 to 35.00	D	F
Very long traffic delays.	35.01 to 50.00	E	F
Extreme traffic delays with intersection capacity exceeded.	> 50.00	F	F

Source: HCM 2000

At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane. The "worst case" movement delay and LOS is reported for the intersection. For all-way stop controlled intersections, LOS is computed for the intersection as a whole.

2.3 TRAFFIC SIGNAL WARRANT ANALYSIS METHODOLOGY

The term "signal warrants" refers to the list of established criteria used by the Caltrans and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This TA uses the signal warrant criteria presented in the latest edition of the California Department of Transportation (Caltrans) California Manual on Uniform Traffic Control Devices *(CA MUTCD)* for all study area intersections. (3)

The signal warrant criteria for Existing conditions are based upon several factors, including volume of vehicular and pedestrian traffic, frequency of accidents, and location of school areas. The Caltrans CA MUTCD indicates that the installation of a traffic signal should be considered if one or more of the signal warrants are met. (3) Specifically, this TA utilizes the Peak Hour Volume-based Warrant 3 as the appropriate representative traffic signal warrant analysis for existing study area intersections for all analysis scenarios. Warrant 3 is appropriate to use for this TA because it provides specialized warrant criteria for intersections with rural characteristics (e.g., located in communities with populations of less than 10,000 persons or with adjacent major streets operating above 40 miles per hour). For the purposes of this study, the speed limit was the basis for determining whether Urban or Rural warrants were used for a given intersection.

Future intersections that do not currently exist have been assessed regarding the potential need for new traffic signals based on future average daily traffic (ADT) volumes, using the Caltrans planning level ADT-based signal warrant analysis worksheets. Traffic signal warrant analyses were performed for the following study area intersection shown in Table 2-3:

TABLE 2-3: TRAFFIC SIGNAL WARRANT ANALYSIS LOCATIONS

ID	Intersection	Jurisdiction
1	Hester St. & Adams Av.	City of San Leandro
4	Doolittle Dr. & Project Dwy.	City of San Leandro, City of Oakland

Traffic signal warrant analyses were performed for all of the full access unsignalized study area intersections. The traffic signal warrant analyses for future conditions are presented in Section 5 *E+P Traffic Analysis* and Section 6 *Horizon Year (2040) Traffic Analysis* of this report.

It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated in order to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with LOS. An

intersection may satisfy a signal warrant condition and operate at or above acceptable LOS or operate below acceptable LOS and not meet a signal warrant.

2.4 QUEUING ANALYSIS

The 95th percentile queuing of vehicles has been assessed at the signalized study area intersections to determine potential queuing deficiencies for turn pockets (note the queuing at unsignalized intersections were addressed as part of the site access evaluation in Chapter 1). Specifically, the queuing analysis is utilized to identify any potential queuing and "spill back" into the adjacent through lanes.

The traffic progression analysis tool and HCM intersection analysis program, Synchro, has been used to assess the potential deficiencies/needs of the intersections with traffic added from the proposed Project. Storage (turn-pocket) length recommendations at the ramps have been based upon the 95th percentile queue resulting from the Synchro progression analysis. The footnote from the Synchro output sheets indicates if the 95th percentile cycle exceeds capacity. Traffic is simulated for two complete cycles of the 95th percentile traffic in Synchro in order to account for the effects of spillover between cycles. In practice, the 95th percentile queue shown will rarely be exceeded and the queues shown with the footnote are acceptable for the design of storage bays.

Although only the 95th percentile queue has been reported in the tables, the 50th percentile queue can be found in the appendix alongside the 95th percentile queue for each study area intersection. The queue length reported is for the lane with the highest queue in the lane group. The 50th percentile or average queue represents the typical queue length for peak hour traffic conditions, while the 95th percentile queue is derived from the average queue plus 1.65 standard deviations. The 95th percentile queue is not necessarily ever observed it is simply based on statistical calculations.

Similar to the peak hour operations analysis, turn pocket storage recommendations have only been recommended if the intersection operations analysis indicates a deficiency during the peak hours.

2.5 MINIMUM LEVEL OF SERVICE (LOS)

2.5.1 CITY OF SAN LEANDRO

The definition of an intersection deficiency has been obtained from the City of San Leandro' 2035 General Plan. LOS D or better is to be maintained at all City-controlled intersections. (4)

2.5.2 CITY OF OAKLAND

The definition of an intersection deficiency has been obtained from the City of Oakland's General Plan. LOS D or better is to be maintained at all City-controlled intersections outside of the Downtown Area and LOS E or better for intersections located within the Downtown Area. (5)

2.5.3 ALAMEDA CMP

The definition of an intersection deficiency has been obtained from the Alameda County 2018 Level of Service Monitoring Report. LOS E or better is to be maintained at CMP intersections, with the exception of the locations that were found to operate at LOS F in the base monitoring years of 1991 and 1992. (1)

2.5.4 CALTRANS

Although Caltrans has gone away from LOS and has focused their determination of traffic impacts and mitigation on vehicle miles traveled (VMT), a minimum LOS D has been utilized for Caltrans controlled ramp-to-arterial intersections for the purposes of this TA.

2.6 SIGNIFICANCE CRITERIA

This section outlines the methodology used in this analysis related to identifying circulation system deficiencies. The following deficiency criteria has been utilized for the study area intersections. To determine whether the addition of project-related traffic at a study intersection would result in a deficiency, the following will be utilized:

- A project-related deficiency is considered significant when a study intersection operates at an acceptable LOS for existing conditions (or pre-project conditions) and the addition of project trips causes the intersection to operate at an unacceptable LOS for existing plus project (E+P) traffic conditions.
- A project-related deficiency is considered significant when a study intersection operates at an unacceptable LOS for existing conditions (or pre-project conditions) and the addition of project trips causes the intersection v/c to increase by 0.05 or more.

This Page Intentionally Left Blank

3 AREA CONDITIONS

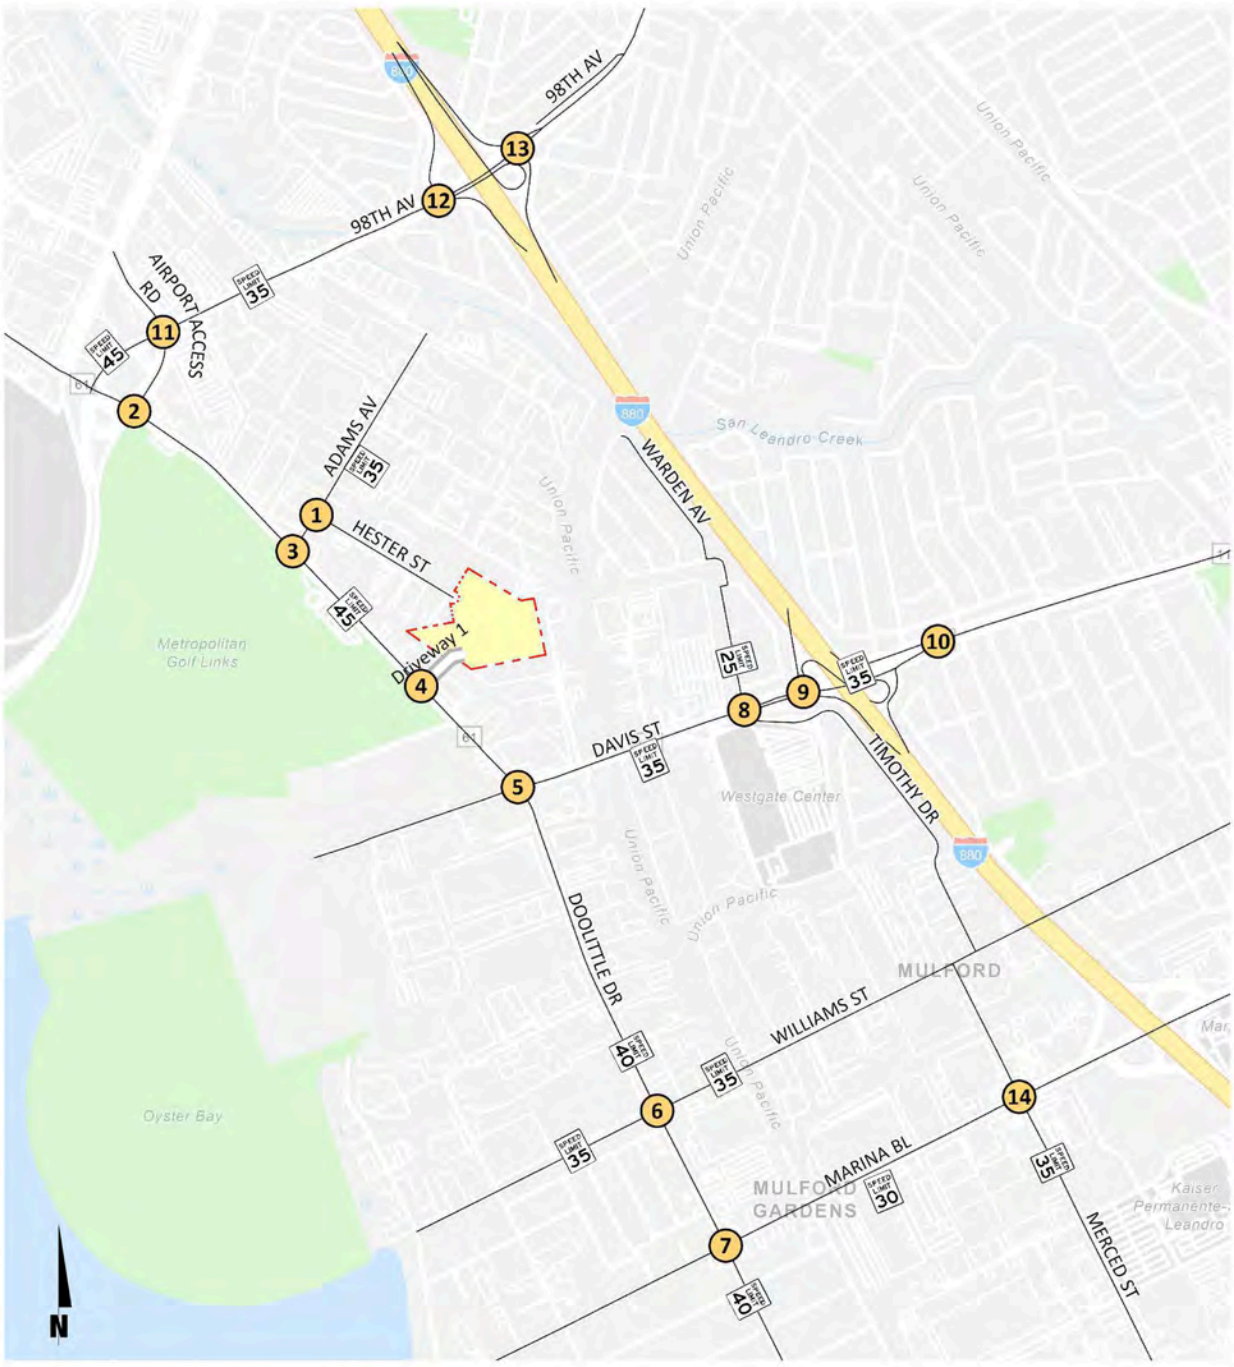
This section provides a summary of the existing circulation network, the City of San Leandro General Plan Circulation Network, and a review of existing peak hour intersection operations, traffic signal warrant, and queuing analyses.

3.1 EXISTING CIRCULATION NETWORK

Pursuant to discussions with the City of San Leandro staff, the study area includes a total of 14 existing intersections as shown previously on Exhibit 1-3. Exhibit 3-1 illustrates the study area intersections located near the proposed Project and identifies the number of through traffic lanes for existing roadways and intersection traffic controls.

3.2 GENERAL PLAN CIRCULATION ELEMENTS

As noted previously, the Project site is located within the City of San Leandro however portions of the study area are lie within the City of Oakland. Exhibit 3-2 shows the City of San Leandro and City of Oakland General Plan Street Classifications.



Arterials can accommodate two to six travel lanes. These facilities serve regional through traffic and connect the major destinations within the City to the freeway system. Access from abutting property is generally restricted. The following roadways are classified as an Arterial within the study area:

- Doolittle Dr.
- Davis St., east of Doolittle Dr.
- Marina Bl.
- Merced St.
- 98th Avenue

Collectors can accommodate two travel lanes with on-street parking and signalized intersections at major intersections. These facilities carry low volumes (less than 10,000 vehicles per day) and connect residential areas to arterials. The following roadways are classified as a Collector within the study area:

- Davis St., west of Doolittle Dr.
- Williams St.
- Timothy Dr./W. Gate Pkwy.
- Adams Av.

EXHIBIT 3-1: EXISTING NUMBER OF THROUGH LANES AND INTERSECTION CONTROLS

2 Doolittle Dr. & Airport Access Rd.
3 Doolittle Dr. & Adams Av.
4 Doolittle Dr. & Dwy. 1
5 Doolittle Dr. & Davis St.
6 Doolittle Dr. & Williams St.
7 Doolittle Dr. & Marina Bl.
8 Warden Av. & Davis St.
9 I-880 SB Ramps & Davis St.
10 I-880 NB Ramps & Davis St.
11 Airport Access Rd. & 98th St.
12 I-880 SB Ramps & 98th St.
13 I-880 NB Ramps & 98th St.
14 Merced St. & Marina Bl.
= Traffic Signal
= Stop Sign
4 = Number of Lanes
D = Divided
U = Undivided
= Free Right Turn
RTO = Right Turn Overlap
N

EXHIBIT 3-2: CITY OF SAN LEANDRO & CITY OF OAKLAND GENERAL PLAN STREET CLASSIFICATION

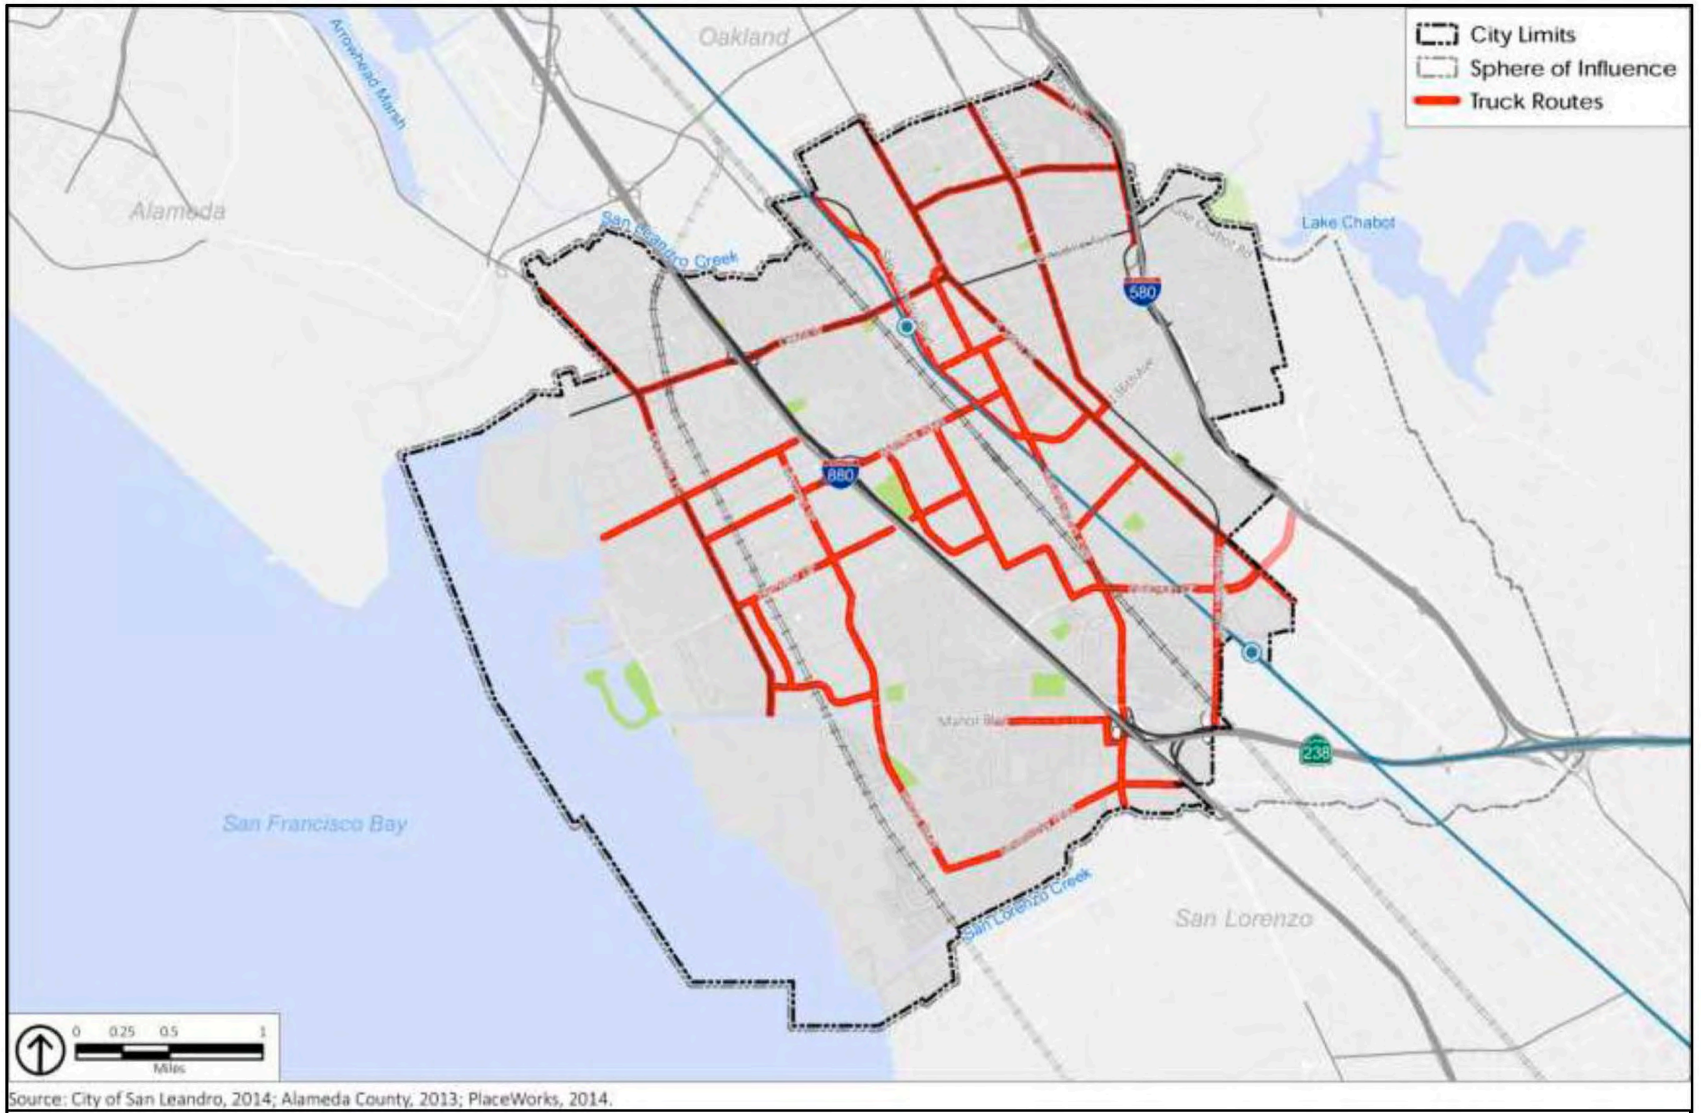
Local Streets/Residential Collector can accommodate two travel lanes with on-street parking typically provided on one side only. These facilities are low-volume and low-speed roadways that connect individual parcels to either Collectors or Arterials. The following roadways are classified as a Local Street within the study area:

- Hester St.
- Warden Av.

3.3 TRUCK ROUTES

The City of San Leandro designated truck route map is shown on Exhibit 3-3. Doolittle Drive, Davis Street, Williams Street, Marina Boulevard, and Merced Street are identified as designated truck routes within the City. These designated truck route maps have been utilized to route truck traffic from the Project throughout the study area.

3.4 TRANSIT SERVICE



Mass transit routes within the study area are shown on Exhibit 3-4. The study area is currently served by Alameda-Contra Costa Transit District (AC Transit), the 3rd largest public bus system in California which serves 13 cities and unincorporated areas of Alameda and Contra Costa counties (364-square mile service area). AC Transit currently has 175,000 riders daily served by their 158 bus lines with approximately 5,400 bus stop locations. AC Transit Routes 34 and 35 runs along Davis Street from east of the I-880 Freeway to Timothy Drive/W. Gate Parkway to Williams Street and Merced Street within the City of San Leandro. AC Transit Route 98 runs along 98th Avenue from Empire Road to east of the I-880 Freeway within the City of Oakland.

The study area is also served by the San Francisco Bay Area Rapid Transit (BART). BART is a public rail transit system that connects the San Francisco Peninsula with communities located in East and South Bays. BART operates 131 miles of track with 50 stations and carry approximately 405,000 trips on an average weekday. The San Leandro BART station is located approximately 1-mile to the east of the I-880 Freeway south of Davis Street on San Leandro Boulevard. The station has connecting transit routes served by AC Transit, LINKS, and the FLEX shuttle. The lines served by the San Leandro BART station include:

- Dublin/Pleasanton to/from Daly City
- Richmond to/from Berryessa/North San Jose Station
- Daly City to/from Berryessa/North San Jose station
- MacArthur to/from Dublin/Pleasanton

The San Leandro LINKS shuttle is a free shuttle to and from BART. There is a North Loop and South Loop. The North Loop runs along Davis Street from the BART station to Marina Boulevard, Merced Street, Williams Street, Doolittle Drive, and Davis Street. There is an existing stop located at Doolittle Drive and Davis Street.

EXHIBIT 3-3: CITY OF SAN LEANDRO TRUCK ROUTES

Source: City of San Leandro, 2014; Alameda County, 2013; PlaceWorks, 2014.

EXHIBIT 3-4: EXISTING TRANSIT ROUTES – AC TRANSIT AND BART

The FLEX Shuttle is a fixed route service similar to LINKS. There is a North Route and South Route through the City of San Leandro. The FLEX Shuttle serves seniors ages 50+ and persons with disabilities (aged 18+) who reside within the City. The North Route runs along portions of Williams Street, Doolittle Drive, Timothy Drive/W. Gate Parkway, and Davis Street (east of Timothy Drive).

There are no existing transit routes along Doolittle Drive near the project site although the San Leandro LINKS shuttle has a stop located at the intersection of Doolittle Drive and Davis Street. Transit service is reviewed and updated periodically to address ridership, budget, and community demand needs. Changes in land use can affect these periodic adjustments which may lead to either enhanced or reduced service where appropriate.

3.5 BICYCLE & PEDESTRIAN FACILITIES

In an effort to promote alternative modes of transportation, the City of San Leandro also includes the existing and proposed bicycle network (see Exhibit 3-5). As shown on Exhibit 3-5, the study area includes existing Class II bike lanes along Adams Street, Doolittle Drive, Williams Street and Merced Street. Class II bike lanes are proposed along Davis Street. Doolittle Drive is proposed as a Class IV bikeway (on-street bike lanes, separated from vehicular traffic via a physical separation). There is also a 5.2-mile shared-use path (Class I) located in the San Leandro Marina Park, which is part of the Bay Trail. The Class I path is an off-street facility that can be used by both bicyclists and pedestrians.

Exhibit 3-6 illustrates the existing pedestrian facilities, which includes sidewalks and crosswalk locations. Sidewalks exist throughout most of the study area with crosswalks provided at all signalized study area intersections.

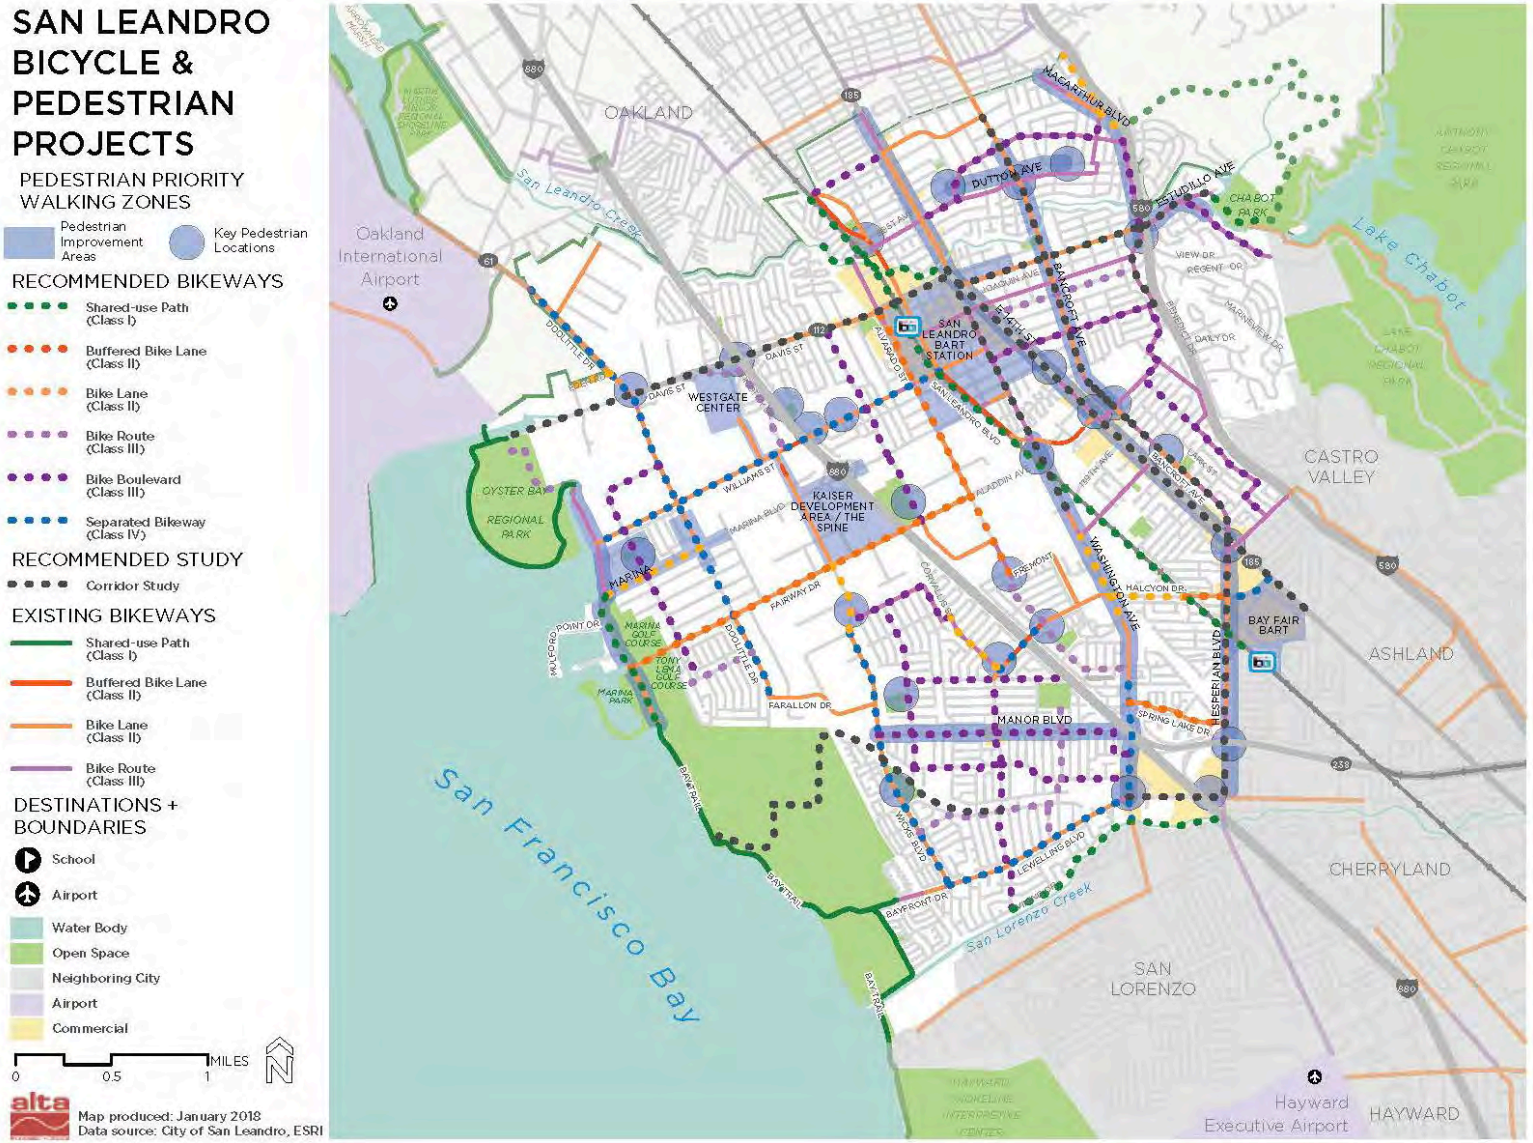
3.6 EXISTING RAIL CROSSINGS

There are 3 major rail lines within the City of San Leandro (Oakland Subdivision, Niles Subdivision, Coastal Subdivision) and these lines connect industrial areas within the City to the Port of Oakland, other markets along the West Coast, and the other areas throughout the State/Nation. All rail lines are under the ownership of Union Pacific Railroad (UPRR). Amtrak also runs along the UPRR within the study area, however, there are no stops within the study area. There are 2 grade-separated railroad crossings within the study area: the overpass on Davis Street and the overpass at the intersection of Doolittle Drive and Airport Access Road. There are also a number of at-grade crossings from various spurs or the UPRR line within the study area:

- Project Driveway, approximately 265-feet east of Doolittle Drive
- Doolittle Drive, approximately 380-feet south of Davis Street
- Williams Street, approximately 840-feet east of Doolittle Drive
- Marina Boulevard, approximately 840-feet east of Doolittle Drive

A queuing analysis will also be prepared to determine whether there are queuing issues at each of the aforementioned at-grade railroad crossings with respect to the adjacent study area intersections. This analysis has been conducted for Horizon Year traffic conditions only.

EXHIBIT 3-5: CITY OF SAN LEANDRO BICYCLE & PEDESTRIAN PLAN



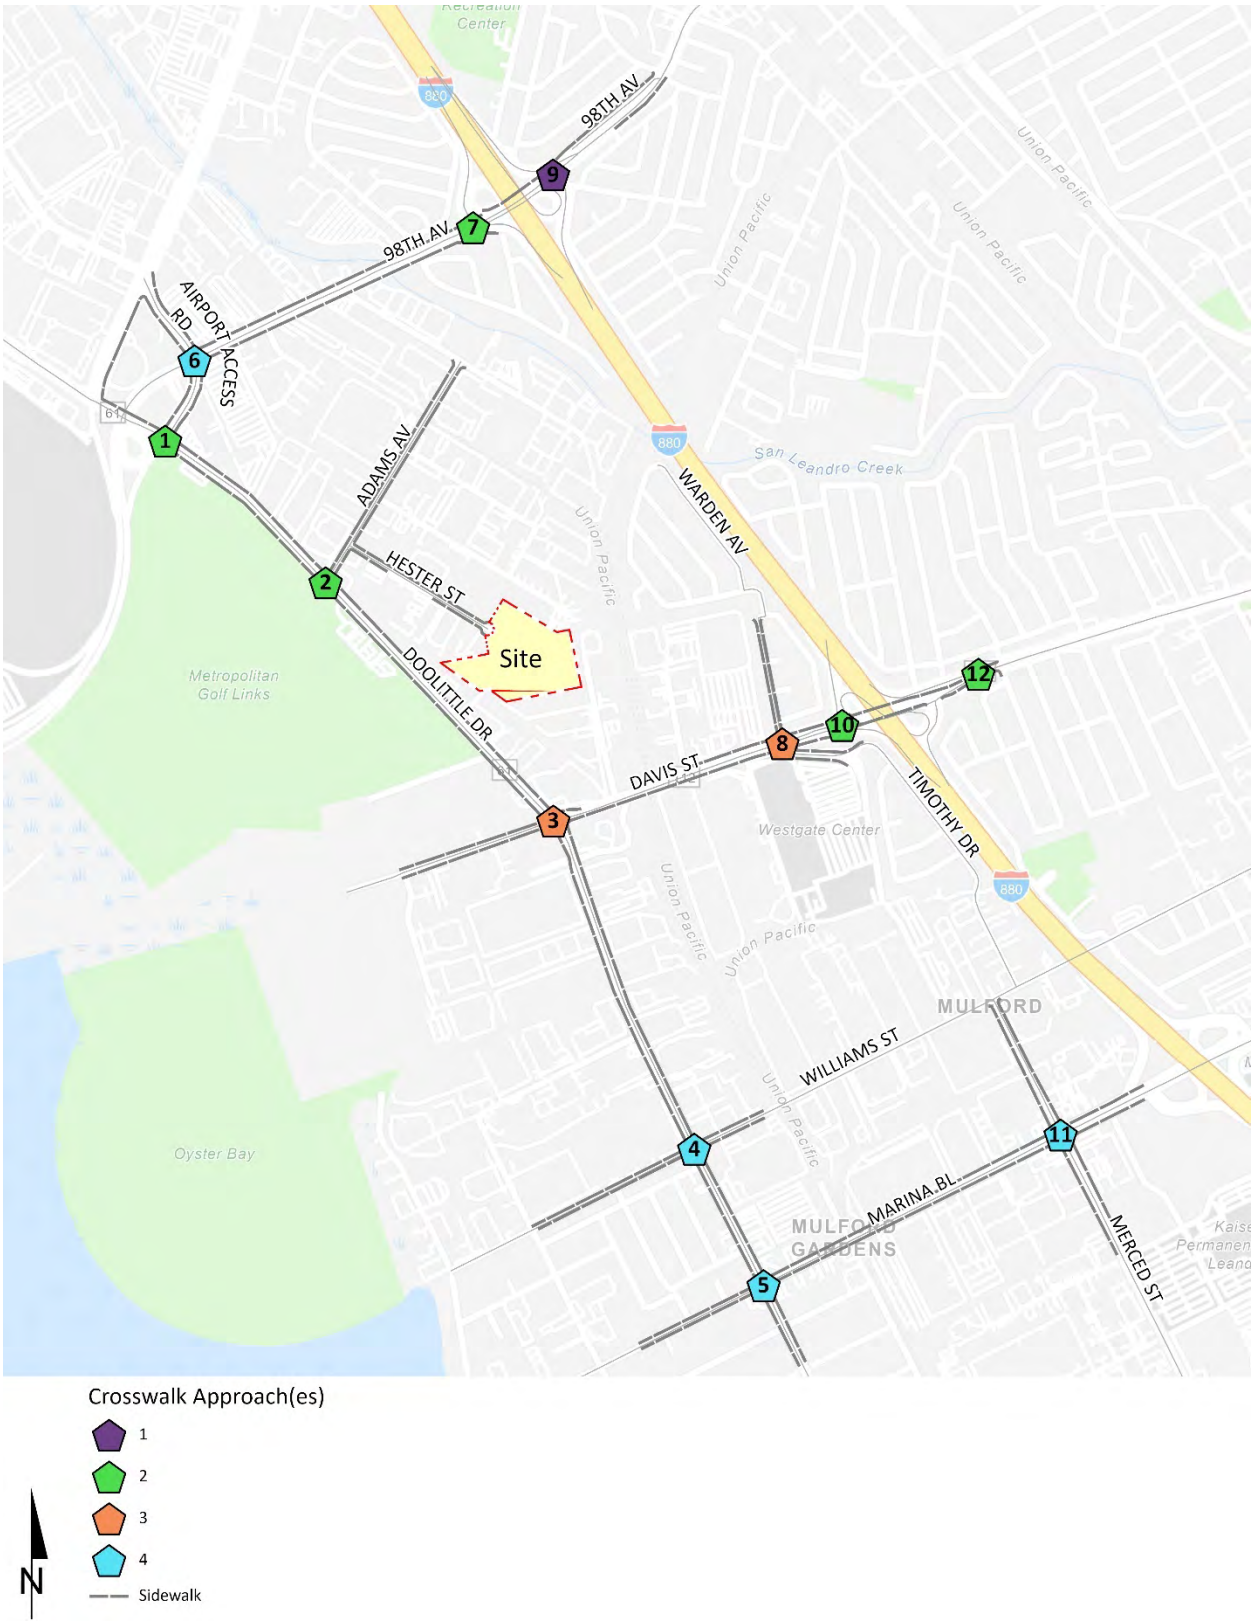


EXHIBIT 3-6: EXISTING PEDESTRIAN FACILITIES

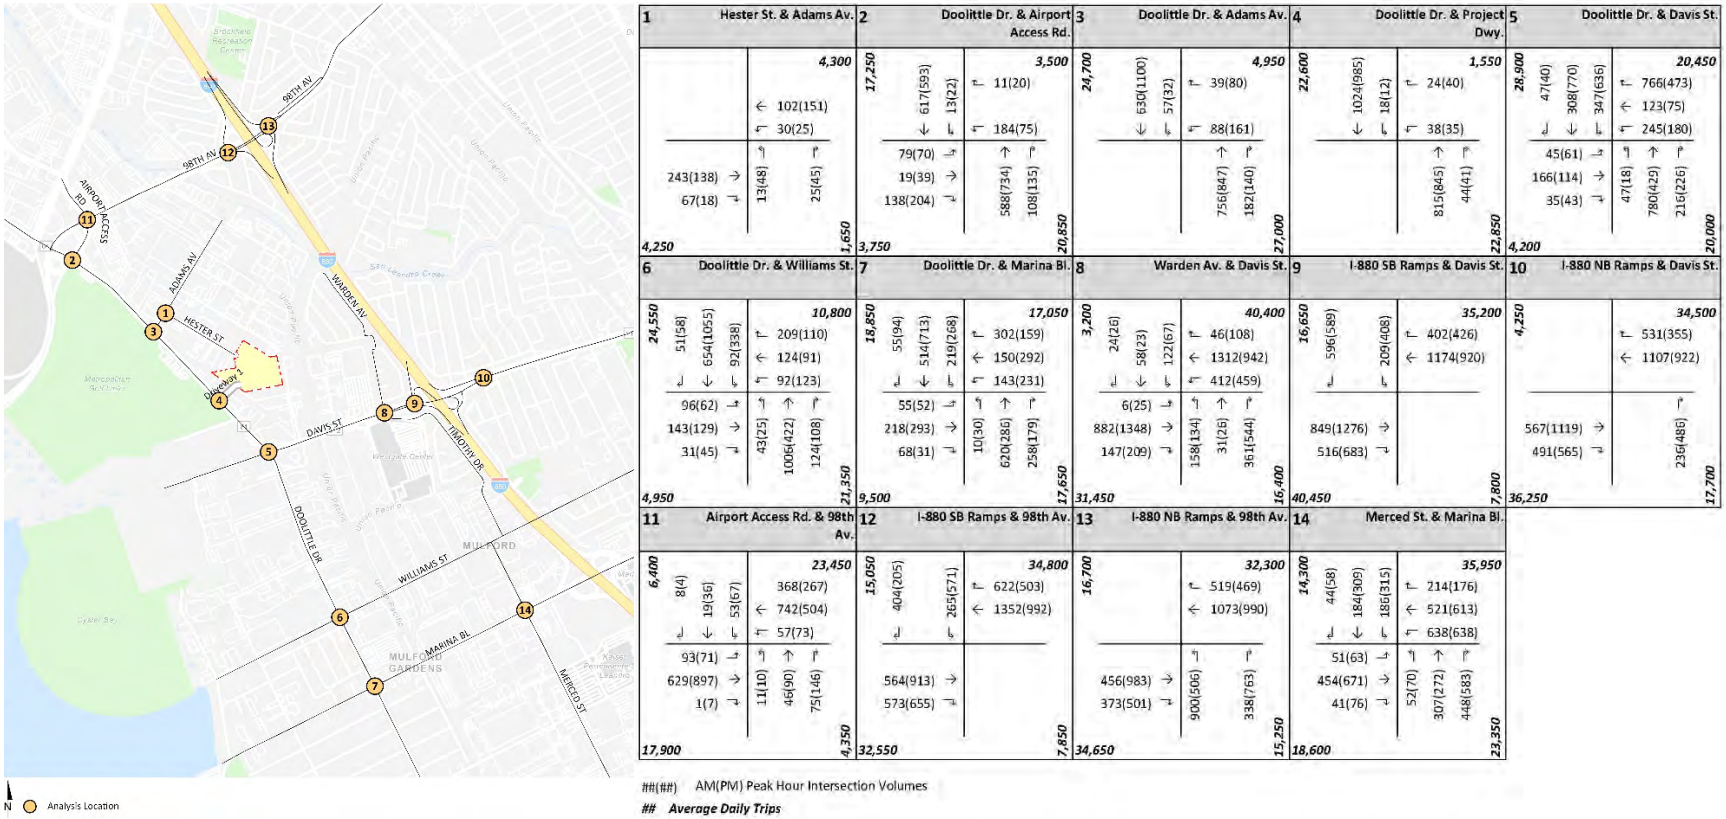
3.7 EXISTING TRAFFIC COUNTS

Due to the currently ongoing COVID-19 pandemic, historic 2015 traffic counts were adjusted by 0.772% per year (compounded annually) over 5 years to reflect 2020 baseline traffic conditions. This annual growth rate is based on the average ABAG projected growth for employment, population, and households for San Leandro. The 2015 counts (adjusted to 2020) were then compared to the recently collected November 2020 counts in order to determine the net changes and to develop an adjustment factor. The average of all applicable locations was calculated to be 127% for AM and 106% for the PM. As such, the locations where historic count data were not available, the 2020 counts that were recently collected were increased by 127% in the AM peak hour and 106% in the PM peak hour. For the locations where both historic and actual 2020 data is available, the final adjusted 2020 traffic volumes used for the purposes of this TA were developed by taking the higher of the 2 volumes (between either the adjusted 2015 or the actual 2020). The following peak hours were selected for analysis for the November 2020 traffic counts:

- Weekday AM Peak Hour (peak hour between 7:00 AM and 11:00 AM)
- Weekday PM Peak Hour (peak hour between 4:00 PM and 7:00 PM)

The raw manual peak hour turning movement traffic count data sheets are included in Appendix 3.1. These raw turning volumes have been flow conserved between intersections with limited access, no access, and where there are currently no uses generating traffic. The traffic counts collected in November 2020 include the vehicle classifications as shown below:

- Passenger Cars
- 2-Axle Trucks
- 3-Axle Trucks
- 4 or More Axle Trucks



Truck traffic has been accounted for in the peak hour operations analysis by entering the percentage of heavy vehicles in the analysis software. The methodology used to derive the existing traffic counts have been reviewed and approved by City staff.

Existing weekday ADT volumes on arterial highways throughout the study area are shown on Exhibit 3-7. Existing ADT volumes were based upon factored intersection peak hour counts collected by Urban Crossroads, Inc. using the following formula for each intersection leg:

Weekday PM Peak Hour (Approach Volume + Exit Volume) x 12 = Leg Volume

Existing weekday AM and weekday PM peak hour intersection volumes are also shown on Exhibit 3-7.

EXHIBIT 3-7: EXISTING (2020) TRAFFIC VOLUMES

3.8 INTERSECTION OPERATIONS ANALYSIS

Existing peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2.2 *Intersection Capacity Analysis* of this report. The intersection operations analysis results are summarized in Table 3-1 which indicates that the study area intersections are currently operating at an acceptable LOS during the peak hours (i.e., LOS D or better), with the exception of the following locations:

- Doolittle Dr. & Davis St. (#5) – LOS E AM peak hour only
- Merced St. & Marina Bl. (#14) – LOS E PM peak hour only

The intersection operations analysis worksheets are included in Appendix 3.2 of this TA.

TABLE 3-1: INTERSECTION ANALYSIS FOR EXISTING (2020) CONDITIONS

#	Intersection	Traffic Control[1]	Delay[2] (secs.)		Volume-to-Capacity (v/c)		Level of Service	
			AM	PM	AM	PM	AM	PM
1	Hester St. & Adams Av.	CSS	11.5	11.0	0.07	0.15	B	B
2	Doolittle Dr. & Airport Access Rd.	TS	20.4	18.3	0.54	0.47	C	B
3	Doolittle Dr. & Adams Av.	TS	9.7	11.0	0.46	0.67	A	B
4	Doolittle Dr. & Project Dwy.	CSS	16.0	15.0	0.18	0.18	C	C
5	Doolittle Dr. & Davis St.	TS	**74.4**	45.4	**0.96**	0.72	**E**	D
6	Doolittle Dr. & Williams St.	TS	25.2	30.7	0.85	0.83	C	C
7	Doolittle Dr. & Marina Bl.	TS	36.2	35.4	0.64	0.71	D	D
8	Warden Av. & Davis St.	TS	41.3	32.8	0.74	0.72	D	C

10	I-880 NB Ramps & Davis St.	TS	11.1	14.6	0.61	0.76	B	B
11	Airport Access Rd. & 98th Av.	TS	30.9	33.4	0.41	0.49	C	C
12	I-880 SB Ramps & 98th Av.	TS	17.9	12.4	0.84	0.58	B	B
13	I-880 NB Ramps & 98th Av.	TS	18.8	34.0	0.80	0.96	B	C
14	Merced St. & Marina Bl.	TS	43.2	**57.9**	0.81	**0.93**	D	**E**

* **BOLD** = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] CSS = Cross-street Stop; TS = Traffic Signal

[2] Per the Highway Capacity Manual (HCM 2000), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

3.9 TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for Existing traffic conditions are based on existing peak hour intersection turning volumes. The following unsignalized study area intersection currently warrants a traffic signal for Existing (2020) traffic conditions based on PM peak hour volumes:

- Doolittle Dr. & Project Driveway (#4)

However, this intersection is currently operating at an acceptable LOS as a cross-street stop-controlled intersection. As such, installation of a traffic signal does not appear necessary from an operational perspective. Existing conditions traffic signal warrant analysis worksheets are provided in Appendix 3.3.

3.10 QUEUING ANALYSIS

A queuing analysis was performed for the signalized study area intersections to assess vehicle queues for the turn pockets that may potentially "spill back" into the adjacent through lanes. Queuing analysis findings are presented in Table 3-2 for Existing traffic conditions. As shown in Table 3-2, the following movements are currently experiencing queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows:

- Doolittle Dr. & Davis St. (#5) – Southbound left PM peak hour only currently spills out of the dual turn pockets and spills back into the adjacent southbound through lane. Due to existing driveways located to the north does not appear feasible as there are existing driveways where access would get affected by an extension of the turn pocket.
- Doolittle Dr. & Davis St. (#5) – Westbound right turn lane AM and PM peak hours currently spills out of the right turn pocket and spills back into the adjacent westbound through lane. The right turn pocket lies within the downgrade of the grade separation over the UPRR rail line and may not be feasible to accommodate additional storage.
- Doolittle Dr. & Williams St. (#6) – Southbound left PM peak hour only is accommodated within the existing two-way left turn lane (striped median) and does not conflict with southbound through traffic.
- Doolittle Dr. & Marina Bl. (#7) – Southbound left AM and PM peak hours currently spills out of the left turn pocket and into the adjacent southbound through lane. The left turn pocket storage cannot be extended due to the existing back-to-back left turn at Barrow Street.
- Doolittle Dr. & Marina Bl. (#7) – Westbound left AM and PM peak hours currently spills out of the left turn pocket and into the adjacent westbound through lane. The left turn pocket storage cannot be extended due to the proximity of the existing driveways to the east and potentially blocking driveway access.
- Warden Av. & Davis St. (#8) – Southbound left AM peak hour only currently spills out of the left turn pocket and into the adjacent southbound through lane. The left turn pocket storage cannot be extended due to the existing intersection of Laura Avenue to the north.
- Airport Access Rd. & 98th Av. (#11) – Westbound left PM peak hour only is accommodated within the existing two-way left turn lane (striped median) and does not conflict with westbound through traffic.

TABLE 3-2: PEAK HOUR TURN LANE QUEUING SUMMARY FOR EXISTING (2020) CONDITIONS

BOLD = 95th percentile queue exceeds the available storage.

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet (1 car length) of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Worksheets for Existing (2020) traffic conditions queuing analysis worksheets are provided in Appendix 3.4.

4 PROJECTED FUTURE TRAFFIC

The Project is proposed to consist of a 106,190 square foot distribution warehouse use (square footage includes mezzanine space). Vehicular and truck traffic access will be provided via Hester Street and Doolittle Drive (see Exhibit 1-2). Specifically, all truck access to the site will occur off Hester Street, employee access is provided via both Hester Street and Doolittle Drive (via Project Driveway), and all van access is to occur off of Doolittle Drive (via Project Driveway). Regional access to the Project site is provided via the I-880 Freeway via 98th Avenue and Davis Street interchanges.

4.1 PROJECT TRIP GENERATION

4.1.1 EXISTING TRIP GENERATION

Existing traffic counts were collected at 880 Doolittle Drive in order to determine the existing trips currently being generated on the site that would be replaced by the Project. Table 4-1 summarizes the counts collected at each driveway and the total for the site. Trip generation has been derived for passenger cars, vans (passenger cars), and trucks. An expanded summary of the existing driveway counts is provided in Appendix 4.1 of this TA.

TABLE 4-1: EXISTING EMPIRICAL DATA

	AM Peak Hour			PM Peak Hour			
Land Use	**In**	**Out**	**Total**	**In**	**Out**	**Total**	**Daily**
Doolittle Access							
Passenger Cars:	61	30	91	17	61	78	792
Vans:	7	45	52	35	1	36	414
Truck Trips:	3	4	7	1	1	2	43

Truck Trips:	3	4	7	1	1	2	45
Total Trips[1]	**83**	**80**	**164**	**60**	**82**	**142**	**1,546**

[1] Total Trips = Passenger Cars + Truck Trips.

4.1.2 PROPOSED PROJECT TRIP GENERATION

Trip generation represents the amount of traffic that is attracted and produced by a development and is based upon the specific land uses planned for a given project. Trip generation estimates for the proposed Project have been developed using tenant supplied data for the proposed facility. Since the trip generation is based on tenant supplied data, trip generation rates from the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10th Edition, 2017, have not been utilized. Table 4-2 summarizes the Project's trip generation. The proposed Project is anticipated to generate 1,136 two-way trips per day with 196 AM peak hour trips and 83 PM peak hour trips.

TABLE 4-2: PROPOSED PROJECT TRIP GENERATION SUMMARY

	AM Peak Hour			PM Peak Hour			
Land Use	**In**	**Out**	**Total**	**In**	**Out**	**Total**	**Daily**
Proposed Project							
Associates/Drivers:	59	0	59	0	0	0	506
Vans:	0	120	120	0	0	0	250
Flex Vehicles:	0	0	0	40	20	60	80
Self Service Kiosk:[1]	8	8	16	11	11	22	272
4+-axle Trucks:	0	1	1	1	0	1	28
Proposed Project Total	**67**	**129**	**196**	**52**	**31**	**83**	**1,136**

[1] Self service kiosk estimate shown is a maximum projection to conduct a conservative analysis. There is no point of sale associated with these trips.

4.1.3 NET NEW TRIP GENERATION

A comparison between the proposed Project trip generation estimates and the existing use is summarized on Table 4-3. For the purposes of this TA, the net new traffic generated by the proposed Project (less the traffic currently being generated by the site) will be evaluated. As shown in Table 4-3, the Project is anticipated to generate 409 fewer two-way trips per day than the existing use with 32 more AM peak hour trips and 58 fewer PM peak hour trips.

TABLE 4-3: TRIP GENERATION COMPARISON

	AM Peak Hour			PM Peak Hour			
Land Use	**In**	**Out**	**Total**	**In**	**Out**	**Total**	**Daily**
Proposed Project							
Passenger Cars:	67	8	75	11	11	22	778

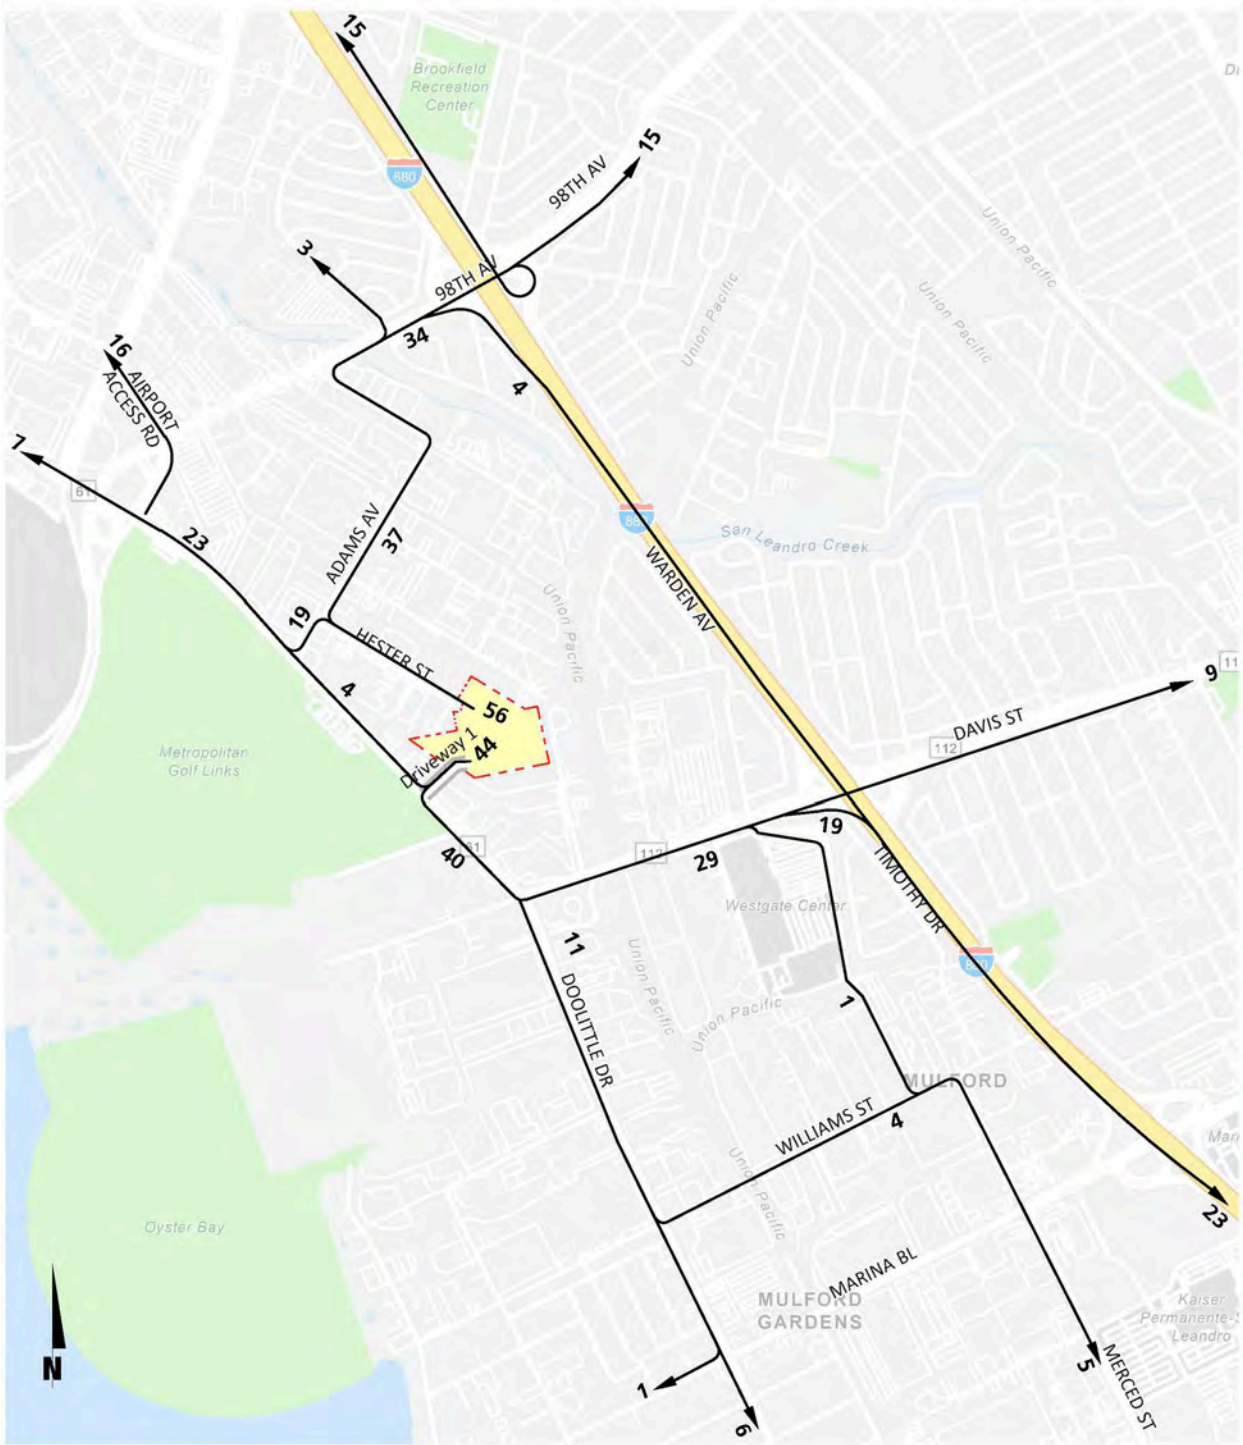
Variance Total (Net New Traffic)	**-16**	**48**	**32**	**-8**	**-50**	**-58**	**-409**

4.2 PROJECT TRIP DISTRIBUTION

Trip distribution is the process of identifying the probable destinations, directions, or traffic routes that will be utilized by Project traffic. The potential interaction between the planned land uses and surrounding regional access routes are considered to identify the route where the Project traffic would distribute. The passenger car trip distribution patterns shown on Exhibit 4-1 are based on the select zone run distribution that was prepared by the City's traffic consultant. However, adjustments have been made to account for the Project access onto Doolittle in addition to other minor changes to routes based on ultimate destination and considerations to the surrounding roadway network. Exhibit 4-2 shows the delivery van/truck distributions and are consistent with the service area zip code data provided by the Project Applicant for the VMT analysis. Each of these distribution patterns was reviewed and approved by the City of San Leandro as part of the traffic study scoping process.



4.3 MODAL SPLIT

The traffic reducing potential of public transit, walking, or bicycling have not been considered in this TA. Essentially, the traffic projections are "conservative" in that these alternative travel modes might be able to reduce the forecasted traffic volumes (employee trips only).

4.4 PROJECT TRIP ASSIGNMENT

The assignment of traffic from the Project area to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project. Based on the identified Project traffic generation and trip distribution patterns, Project ADT and peak hour intersection turning movement volumes are shown on Exhibit 4-3.

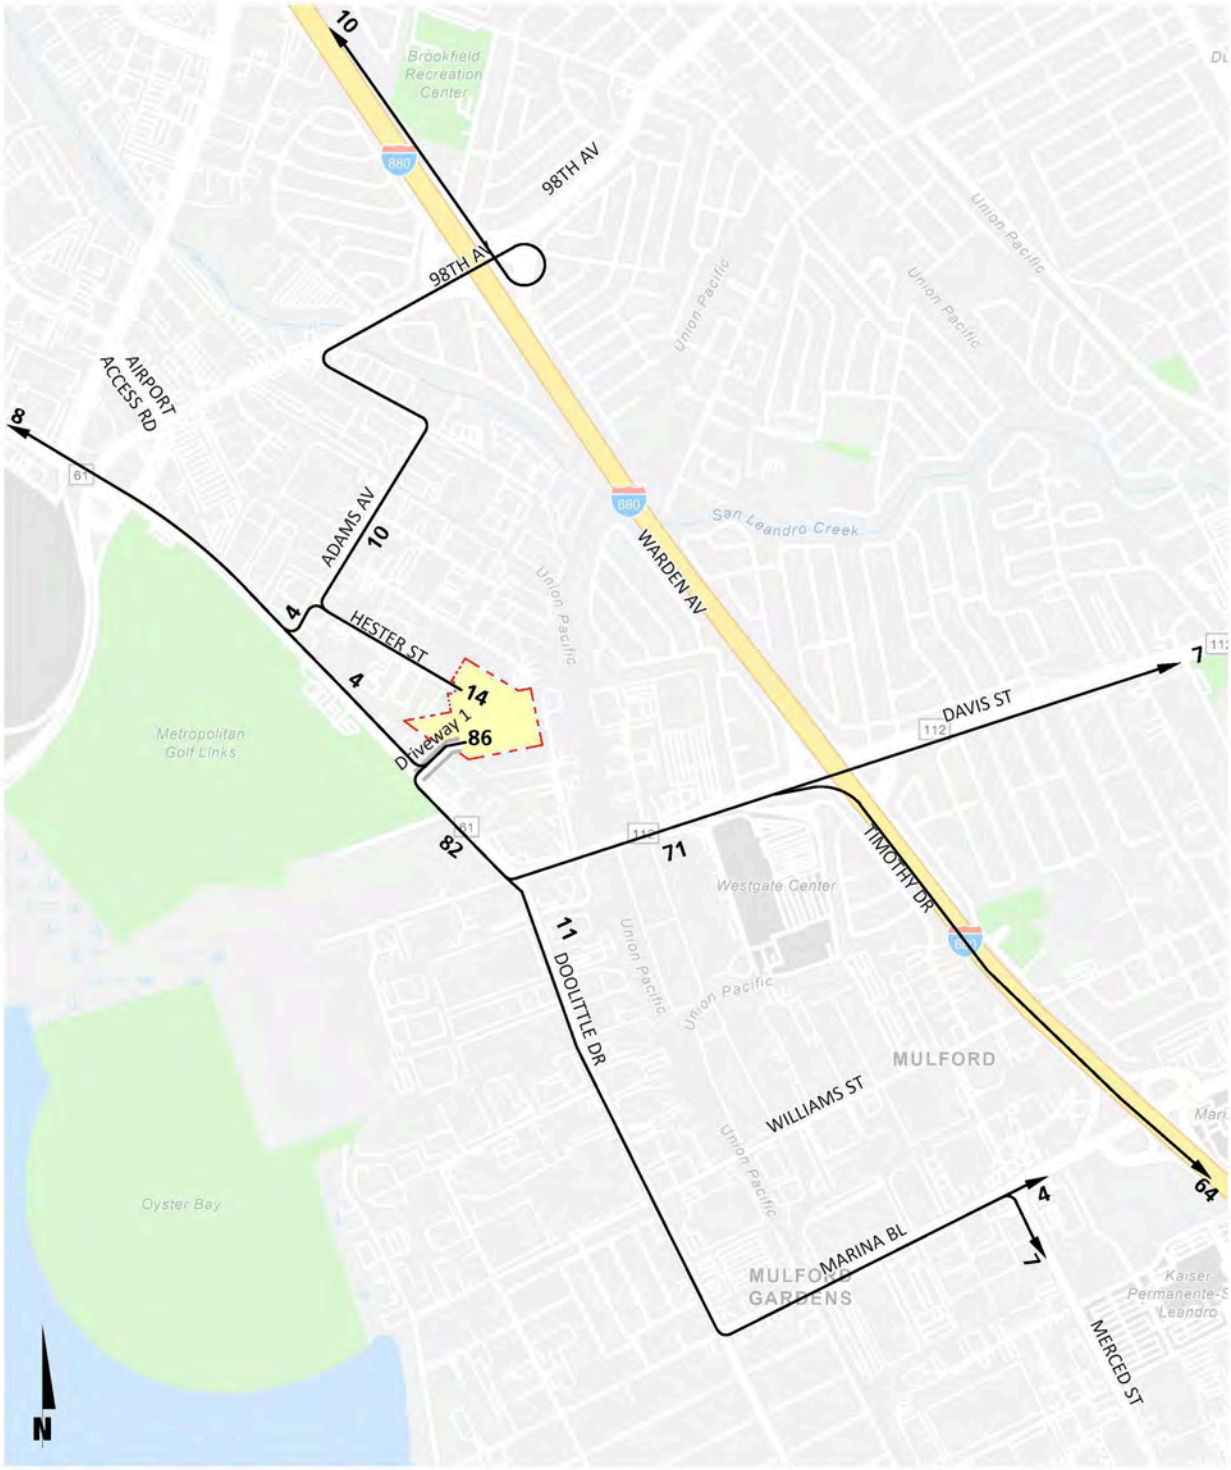

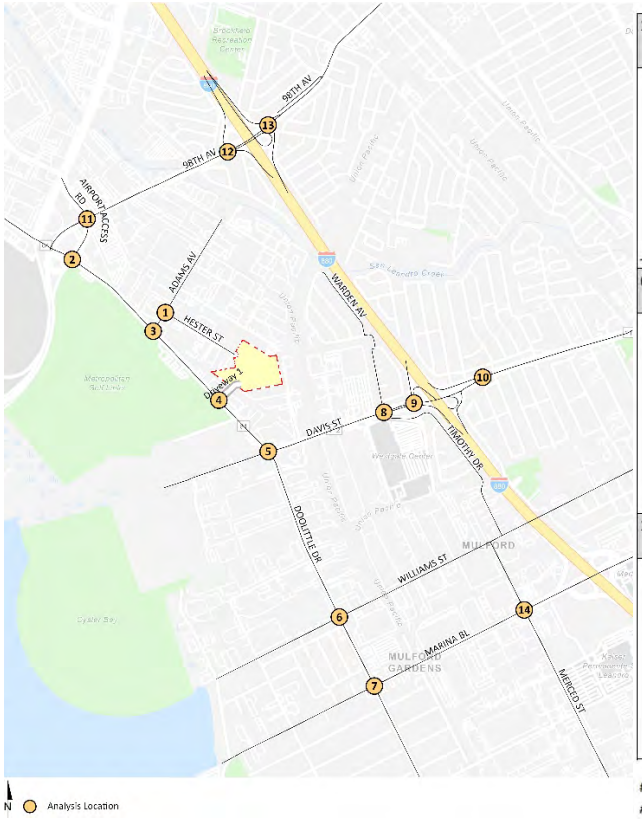

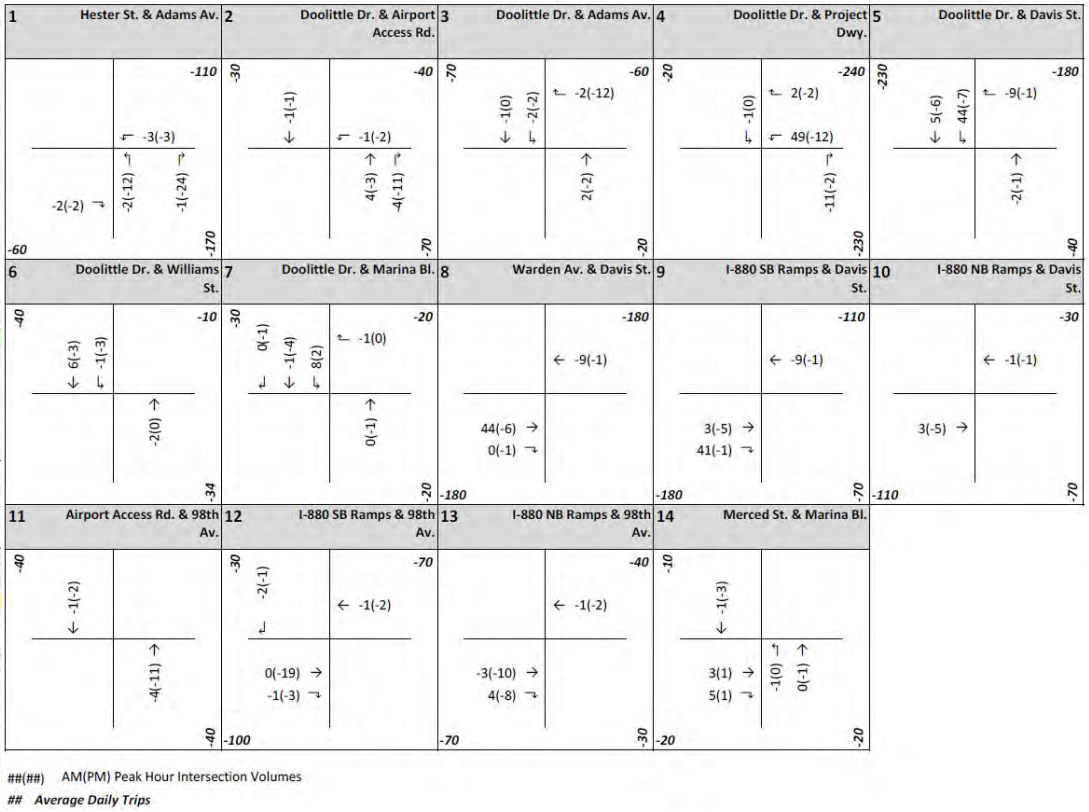

EXHIBIT 4-3: PROJECT ONLY TRAFFIC VOLUMES

4.5 HORIZON YEAR (2040) TRAFFIC FORECASTS

The City's traffic consultant has provided future long-range Horizon Year (2040) Without Project traffic forecasts based on the Alameda Countywide Travel Demand Model using accepted procedures for model forecast refinement and smoothing for study area intersections located within the City of San Leandro. Traffic Counts

The traffic forecasts reflect the area-wide growth anticipated between Existing (2020) conditions and Horizon Year (2040) traffic conditions. In most instances the traffic model zone structure is not designed to provide accurate turning movements along arterial roadways unless refinement and reasonableness checking is performed. Therefore, the Horizon Year peak hour forecasts were refined using the model derived long range forecasts, base (validation) year model forecasts, along with existing baseline traffic (adjusted baseline).

The refined future peak hour approach and departure volumes obtained from the model output data are then entered into a spreadsheet program consistent with the National Cooperative Highway Research Program (NCHRP Report 255), along with initial estimates of turning movement proportions. A linear programming algorithm is used to calculate individual turning movements which match the known directional roadway segment forecast volumes computed in the previous step. This program computes a likely set of intersection turning movements from intersection approach counts and the initial turning proportions from each approach leg.

The future Horizon Year (2040) Without Project traffic forecasts provided by the City's traffic consultant are included in Appendix 4.2. The future Horizon Year (2040) Without Project peak hour turning movements were then reviewed by Urban Crossroads, Inc. for reasonableness, and in some cases, were adjusted to achieve flow conservation. Flow conservation checks ensure that traffic flow between two closely spaced intersections, such as two adjacent driveway locations, is verified in order to make certain that vehicles leaving one intersection are entering the adjacent intersection and that there is no unexplained loss of vehicles. The result of this traffic forecasting procedure is a series of traffic volumes which are suitable for traffic operations analysis. Lastly, net new Project traffic was then added to develop Horizon Year (2040) With Project traffic forecasts.

This Page Intentionally Left Blank

5 E+P TRAFFIC ANALYSIS

This section discusses the traffic forecasts for Existing Plus Project (E+P) conditions and the resulting intersection operations, traffic signal warrant, and queuing analyses.

5.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed to be in place for E+P conditions are consistent with those shown previously on Exhibit 3-1.

5.2 E+P TRAFFIC VOLUME FORECASTS

This scenario includes Existing (adjusted) traffic volumes plus net new Project traffic. The ADT and peak hour intersection turning movement volumes, which can be expected for E+P traffic conditions are shown on Exhibit 5-1.

5.3 INTERSECTION OPERATIONS ANALYSIS

E+P peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 2 *Methodologies* of this TA. The intersection analysis results are summarized in Table 5-1, which indicates that there are no additional study area intersections anticipated to operate at an unacceptable LOS, in addition to the locations identified previously under Existing (2020) traffic conditions. The intersection operations analysis worksheets are included in Appendix 5.1 of this TA.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] Per the Highway Capacity Manual (HCM 2000), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[2] CSS = Cross-street Stop; TS = Traffic Signal

[3] For intersections operating below LOS D, an impact would occur if new trips added by the project causes the v/c to increase by 0.05 or more.

##(##) AM(PM) Peak Hour Intersection Volumes

Average Daily Trips

5.4 TRAFFIC SIGNAL WARRANTS ANALYSIS

There are no other unsignalized study area intersections anticipated to meet peak hour volume-based traffic signal warrants under E+P traffic conditions in addition to the location previously warranted under Existing traffic conditions (see Appendix 5.2).

5.5 QUEUING ANALYSIS

A queuing analysis was performed for the signalized study area intersections to assess vehicle queues for the turn pockets that may potentially "spill back" into the adjacent through lanes. Queuing analysis findings are presented in Table 5-2 for E+P traffic conditions. As shown in Table 5-2, the following turning movements are anticipated to experience queuing issues for E+P traffic conditions and are consistent with existing deficient turning movements, however, the addition of Project traffic to these existing deficiencies result in nominal changes:

- Doolittle Dr. & Davis St. (#5) – Southbound left PM peak hour only
- Doolittle Dr. & Davis St. (#5) – Westbound right turn lane AM and PM peak hours
- Doolittle Dr. & Williams St. (#6) – Southbound left PM peak hour only
- Doolittle Dr. & Marina Bl. (#7) – Southbound left AM and PM peak hours
- Doolittle Dr. & Marina Bl. (#7) – Westbound left AM and PM peak hours
- Warden Av. & Davis St. (#8) – Southbound left AM peak hour only
- Airport Access Rd. & 98th Av. (#11) – Westbound left PM peak hour only

Worksheets for E+P traffic conditions queuing analysis worksheets are provided in Appendix 5.3.

5.6 RECOMMENDED IMPROVEMENTS

Improvement strategies have been recommended at intersections that have been identified as deficient under E+P traffic conditions and where the addition of Project traffic would have a significant effect. Improvements have been identified in an effort to achieve an acceptable LOS (i.e., LOS D or better).

BOLD = 95th percentile queue exceeds the available storage.

[1] Stacking Distance is acceptable if the required stacking distance is less than or equal to the stacking distance provided. An additional 25 feet (1 car length) of stacking which is assumed to be provided in the transition for turn pockets is reflected in the stacking distance shown on this table, where applicable.

[2] 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

5.6.1 Recommended Improvements To Address Deficiencies At Intersections

As shown previously in Table 5-1, the addition of Project traffic at the two deficient locations is anticipated to result in a change to the v/c ratio of less than 0.05. As such, no improvements have been recommended at these locations for E+P traffic conditions.

5.6.2 Recommended Improvements To Address Deficiencies On Queues

As shown previously in Table 5-2, there are movements anticipated to experience queuing issues during the weekday AM or weekday PM peak 95th percentile traffic flows under E+P traffic conditions. However, these are existing queuing issues, and the addition of Project traffic is anticipated to have a nominal effect on the peak hour queues. As discussed previously in Section 3.10 *Queuing Analysis*, improvements at some of the turn lanes would not be feasible given the physical surroundings. The peak hour intersection operations analyses for these study area intersections show that the addition of Project traffic is not anticipated to have a significant effect (v/c increase of less than 0.05). As such, consistent with the peak hour intersection operations analyses, no improvements have been recommended to address the peak hour queuing deficiencies.

6 HORIZON YEAR (2040) TRAFFIC ANALYSIS

This section discusses the methods used to develop Horizon Year (2040) traffic forecasts and the resulting intersection operations, traffic signal warrant, and queuing analyses.

6.1 ROADWAY IMPROVEMENTS

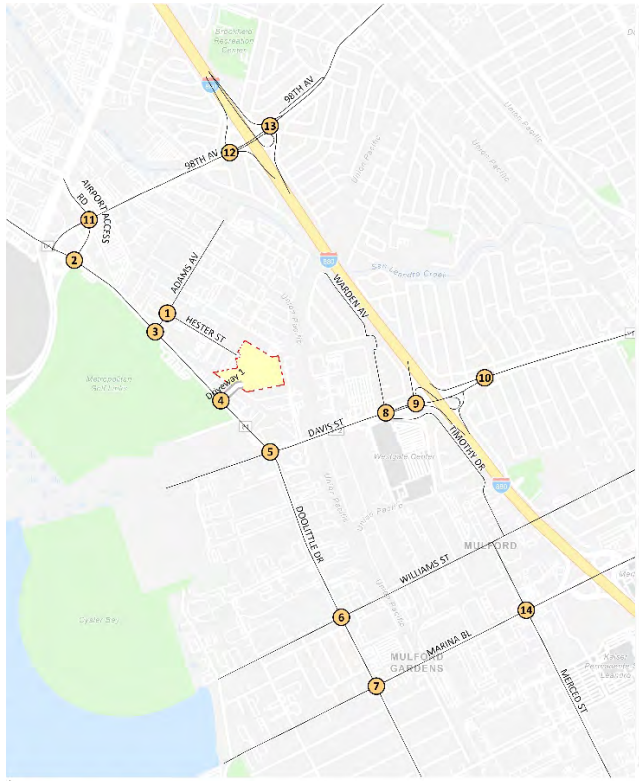
The lane configurations and traffic controls assumed to be in place for Horizon Year (2040) conditions are consistent with those shown previously on Exhibit 3-1.

6.2 HORIZON YEAR (2040) WITHOUT PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-processed volumes obtained from the Alameda Countywide Travel Demand Model (see Section 4.5 *Horizon Year (2040) Traffic Forecasts* of this TA for a detailed discussion on the post-processing methodology). The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year (2040) Without Project traffic conditions are shown on Exhibit 6-1.

6.3 HORIZON YEAR (2040) WITH PROJECT TRAFFIC VOLUME FORECASTS

This scenario includes the refined post-processed volumes obtained from the Alameda Countywide Travel Demand Model plus net new Project traffic. The weekday ADT and weekday AM and PM peak hour volumes which can be expected for Horizon Year (2040) With Project traffic conditions are shown on Exhibit 6-2.



6.4 INTERSECTION OPERATIONS ANALYSIS

LOS calculations were conducted for the study intersections to evaluate their operations under Horizon Year (2040) Without Project conditions with roadway and intersection geometrics consistent with Section 6.1 *Roadway Improvements*. As shown in Table 6-1, the following study area intersections are anticipated to operate at an unacceptable LOS during the peak hours under Horizon Year (2040) Without Project traffic conditions:

- Doolittle Dr. & Davis St. (#5) – LOS F AM and PM peak hours
- Doolittle Dr. & Marina Bl. (#7) – LOS E PM peak hour only
- Airport Access Rd. & 98th Av. (#11) – LOS F PM peak hour only
- Merced St. & Marina Bl. (#14) – LOS E AM and PM peak hours

The addition of Project traffic is anticipated to have a significant effect on the intersection of Doolittle Drive and the Project Driveway only. The intersection operations analysis worksheets for Horizon Year (2040) Without and With Project traffic conditions are included in Appendix 6.1 and Appendix 6.2 of this TA, respectively.

* **BOLD** = Level of Service (LOS) does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[1] Per the Highway Capacity Manual (HCM 2000), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

[2] CSS = Cross-street Stop; TS = Traffic Signal

[3] For intersections operating below LOS D, an impact would occur if new trips added by the project causes the v/c to increase by 0.05 or more.

[4] Per the HCM methodology, if volume-to-capacity exceeds 1.00 then the level of service is LOS F.

6.5 TRAFFIC SIGNAL WARRANTS ANALYSIS
