SAN LEANDRO INDUSTRIAL AIR QUALITY AND GREENHOUSE GAS ASSESSMENT EVALUATION

Mr. Mark English,

Urban Crossroads, Inc. is pleased to provide the following Air Quality and Greenhouse Gas Assessment Evaluation (referred to as Memo) for San Leandro Industrial development which is located at 1750 Doolittle Drive in the County of San Leandro. For the purposes of this assessment, the Project is proposed to consist of the development of a warehouse building with up to 80,727 square feet of building space. However, the final site plan current reflects 80,693 square feet. As such, the analysis is considered more conservative as it is based on a lightly higher square footage. The Project is anticipated to have an opening year of 2024.

BACKGROUND

A significant adverse air quality impact may occur when a project individually or cumulatively interferes with progress toward the attainment of an air quality standard by releasing emissions that equal or exceed the established long term quantitative thresholds for pollutants or causes an exceedance of a state or federal ambient air quality standard for any criteria pollutant.

Primary criteria pollutants are emitted directly from a source (e.g., vehicle tailpipe, an exhaust stack of a factory, etc.) into the atmosphere. Commonly found primary criteria pollutants include reactive organic gases (ROG), nitric oxides (NO_x), carbon monoxide (CO), and particulate matter (PM_{10} and $PM_{2.5}$; PM_{10} is particulate matter measuring no more than 10 microns in diameter, while $PM_{2.5}$ is fine particulate matter measuring no more than 2.5 microns in diameter). The project site is located within the San Francisco Bay Area Air Basin and falls under the jurisdiction of the Bay Area Air Quality Management District (BAAQMD).

The Basin has been designated as being a nonattainment area for the State ozone (O_3), particulate matter 10 microns in diameter or less (PM_{10}), and particulate matter 10 microns in diameter or less ($PM_{2.5}$) standards, and nonattainment for the federal O_3 and $PM_{2.5}$ standards Applicable air quality thresholds and the project's corresponding emissions are summarized below.

PROJECT AIR QUALITY EMISSIONS SUMMARY

CONSTRUCTION EMISSIONS

BAAQMD recommends the quantitative regional significance thresholds for temporary construction activities and long-term project operation in the Basin in order to maintain and achieve attainment for typical criteria pollutants. The significance thresholds and the project's corresponding daily emissions are listed in Table 1:

TABLE 1: CONSTRUCTION EMISSIONS SUMMARY

Source	Emissions (lbs/day)			
	VOC	CO	PM_{10}	$PM_{2.5}$
Regional Construction Emissions Daily				
Maximum Annual Emissions	24.50	47.00	24.50	12.70

Threshold Exceeded?	NO	NO	NO	NO

Maximum Annual Emissions	0.32	1.72	0.22	0.13
BAAQMD Regional Threshold	10	10	15	10
Threshold Exceeded?	NO	NO	NO	NO

REGIONAL OPERATIONAL EMISSIONS

The estimated maximum daily operational emissions are summarized on Table 2. As shown, the Project is not anticipated to exceed the numerical thresholds of significance established by the BAAQMD for emissions of any criteria pollutants so air quality impacts are less than significant.

PROJECT GHG ANALYSIS

Climate change is the observed increase in the average temperature of the Earth's atmosphere and oceans along with other substantial changes in climate (such as wind patterns, precipitation, and storms) over an extended period of time. Climate change is the result of numerous, cumulative sources of GHG emissions.

GHGs occur naturally and from human activities. Human activities that produce GHGs are the burning of fossil fuels (coal, oil and natural gas for heating and electricity, gasoline and diesel for transportation); methane from landfill wastes and raising livestock; deforestation activities; and some agricultural practices. GHGs produced by human activities include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). Emissions of GHGs affect the atmosphere directly by changing its chemical composition while changes to the land surface indirectly affect the atmosphere by changing the way in which the Earth absorbs gases from the atmosphere. Project activities will result in emissions of GHGs.

The majority of individual projects do not generate sufficient GHG emissions to directly influence climate change. However, physical changes caused by a project can contribute incrementally to cumulative effects that are significant, even if individual changes resulting from a project are

limited. BAAQMD has developed significance thresholds applicable to GHG emissions, which the City has applied to the project's GHG emissions, summarized below.

As shown on Table 3, the project would not exceed the screening threshold of 1,100 MTCO2e. The 1,100 MTCO2e threshold is based on the BAAQMD's screening threshold and has been used by other agencies in northern California, including the City. Thus, project-related emissions would not have the potential to have a significant direct or indirect impact on GHG and climate change. Detailed construction and operational model outputs are presented in Attachment A.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	8.85	annual days of extreme heat
Extreme Precipitation	5.80	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	9.75	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	2	0	0	N/A
Sea Level Rise	1	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.
